**General Antenna Parameters and Design**

Electrical Delay (one direction)	1.202 ns
----------------------------------	----------

After long term use with 100W radiated power, only a slight warming of the dipole near the feedpoint can be measured.

The dipole is made of standard semirigid coaxial cable. The center conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore short-circuited for DC-signals. On some of the dipoles, small end caps are added to the dipole arms in order to improve matching when loaded according to the position as explained in the "Measurement Conditions" paragraph. The SAR data are not affected by this change. The overall dipole length is still according to the Standard.

No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

## ANNEX I G-Sensor

### Functional description

- (1) Trigger processing:
  - (a) If G sensor  $|\Delta\text{motion}| > 0.5(\text{m/s}^2)$  then  $\text{DSI}=2$  (power reduction)
  - (b) If G sensor  $|\Delta\text{motion}| < 0.5(\text{m/s}^2)$  lasts for 15second then  $\text{DSI}=0$  (use full power)
- (2) Error handle:
  - (a) System read i2c/data to determine if G-sensor work well. If G-sensor is damaged then always use  $\text{DSI}=2$  (power reduction)
  - (b) System can be aware of G-sensor is damaged within 1ms via SPI4 interface
