Dear Tim,

We have uploaded all the modified reports and exhibits, pls double check. I brief your comments as belows:

1. User manual, tune-up procedure have been modified according your comments.
2. Te related exhibits of GSM module will be provided by Chi-Mei.
3. There is no additional BT schematic because E-TEN just used BT chipset on their main board, and they already provided main board schematic.
4. Photo has been updated.
5. We have re-tested the spurious radiation worse case of part 24 by transmittig BT simutaneously, and no new event was found. The statment of no new event has been updated in part 24 report.
6. E-TEN has modified their power target to 28.3 dBm, and tune-up procedure and part 24 product spec have been modified.
7. We have re-tested part of SAR, including BT co-location, body SAR with crest factor 4 (it is GPRS class 10) and SAR report has been modified.
8. The testing distance between EUT and phantom is 1.5 cm (comment item 20).
9. For the comment item 22, though hot spot is on the scanning edge, but there is no warning of " Max SAR outside" in all our head testing. If the real max SAR is outside the scanning area, the DASY4 will show "MAX SAR outside", then we need to re-test the channel. However, the testing for this product , we never found the similar warning. Therefore, we consider our testing data is available.

If you find any issue remained for the updated exhibits or reports, pls inform me asap.

Thanks a lot for help.

B.R.  
Daniel
