FCCID: Z8H89FT0002
Software attestation

The PMP450 AP software provides selectable RF channels which takes into account band edge frequencies to maintain regulatory compliance, essentially capping maximum output power and locking RF frequencies. For FSK mode this is locked from 5740MHz to 5835MHz with attenuation registers set to not less than E0 at the lower band edge. These settings cannot be overridden by the end user or professional installer.

Sincerely,

Steven M. Payne
