Section 1. Summary of Test Results

Manufacturer: Andrew Corporation

Model No.: Tri-Medium Power Radio Module TMPRM1900

Parts No.: RF100721

General: **All measurements are traceable to national standards**

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 24, Subpart E.

DC voltages and DC currents per 2.1033(c)(8)

The input supply to the transmitter was set at 28VDC. The RF power output was measured with the indicated voltage and current applied into the final RF amplifying device(s).

TMPRM1900 Amplifier

RF Output, DC Current and RF Input Power are all average values.

Measured Rated RF output: 47.0dBm (50W)

Measured DC voltage: 28.0V

Measured DC current: 7.30A (TX0)

Measured Minimum RF output: 6.2dBm (4.2mW)

Measured DC voltage: 28.0V

Measured DC current: 3.20 A(TX0)

Tune-up procedure per 2.1033(c) (9)

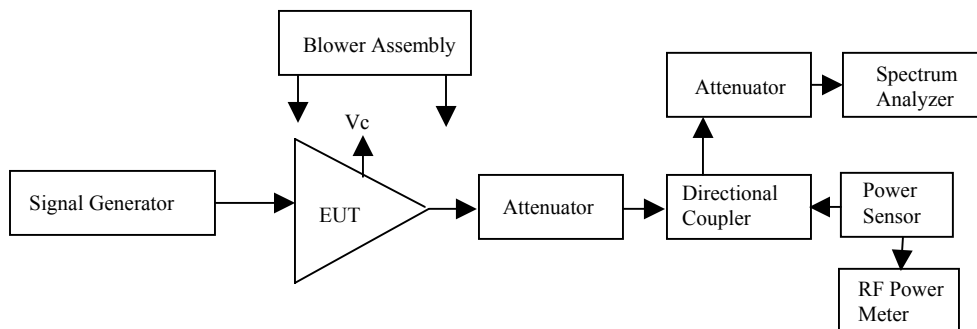

There are no user accessible adjustments or tuning in this amplifier. All necessary adjustments and tuning are performed during manufacture of the product. Any adjustments or tuning after service or repair are done as part of that process as special equipment is required to perform such adjustments.

Description of Operation

This device is a single carrier power amplifier used in BTS in downlink spectrum of 1900MHz PCS band. All measurements shall be made at room temperature and at nominal DC input voltage.

System Diagram

See Attachment.

General EUT Setup

Section 3. RF Output Power

Name of Test:	<i>RF Output Power</i>	Test Standard:	22.913(a) 24.232(a)
Tested By:	WEI LI	Test Date:	04/29/2008-05/09/2008

Minimum Standard: Para. No. 22.913(a). The maximum effective radiated power (ERP) of base station transmitters and cellular repeaters must not exceed 500 Watts (57dBm).

Para. No. 24.232(a). The maximum peak output power of base transmitters should not exceed 100 Watts EIRP (50dBm).

Method of Measurement: The EUT is a RF amplifier. The manufacturer does not provide an antenna for sale with the product, hence EIRP is not measured nor calculated.

Per 2.1046: The RF Power Output shall be measured at the output connector of the EUT. The output level shall be rated power +1 dB, -3 dB over the PCS frequency band: 1930-1990 MHz. The tolerance range is per TIA/EIA-97-D, Section 4.3.1.3.

Using power meter, power measurements shall be taken at the low band edge, mid, and high band edge frequencies for all modulations listed on Page 5.

Test Result:

Complies

Test Data:

Rated Output Power – Normal Condition

The inputs are set to generate rated average output power and crest factor for the signals intended.

PCS Band	Channel	Modulation	Power Output (dBm)	Rated Power (dBm)	Tolerance
Downlink	Low	GSM	47.17	47.0	+0.17
	Mid	GSM	47.00	47.0	0
	High	GSM	47.20	47.0	+0.20
	Low	EDGE	45.01	44.77	+24
	Mid	EDGE	44.75	44.77	-0.02
	High	EDGE	45.04	44.77	+0.27
Total Power at Amplifier RF Input (dBm)	-1.12/GSM & -3.40/EDGE				
Ref Offset	Ref offset=Cable&Attenuator&Coupler Attenuation=46.2dB				

Conclusion:

As indicated on Page 5 & measurement results on Page 9, supported output power per carrier is 50W for GSM and 30W for EDGE, which does not exceed the 100 Watt (50dBm) peak power limit.

Section 4. Occupied Bandwidth

Name of Test:	<i>Occupied Bandwidth</i>	Test Standard:	<i>2.1049(i)</i>
Tested By:	WEI LI	Test Date:	04/29/2008-05/09/2008

Minimum Standard: Not defined by FCC. Input vs. Output.

Method of Measurement: Spectrum Analyzer Settings:
 RBW: CDMA2000 (30 kHz), WCDMA (100KHz), CDMA(30KHz),
 GSM (3 kHz), EDGE (3KHz), NADC (1 kHz) and CDPD (1 kHz)
 VBW: \geq RBW
 Span: As required
 Sweep: Auto
 Input Signal Characteristics: Generated from Signal Generator
 RF level: Rated, recommended by manufacturer

Test Result:

Complies

Section 5. Spurious Emissions at Antenna Terminals

Name of Test:	<i>Spurious Emissions at Antenna Terminals</i>	Test Standard:	22.917 24.238(a)
Tested By:	WEI LI EDWARD LEE	Test Date:	04/29/2008-05/09/2008

Minimum Standard: Para. No. 22.917(e). The mean power of emissions must be attenuated below the mean power of the unmodulated carrier on any frequency twice or more than twice the fundamental emission by at least $43 + 10 \log P$. This is equivalent to -13 dBm absolute power.

Para. No. 24.238(a). The magnitude of each spurious and harmonic emission that can be detected when the equipment is operated under conditions specified in the instruction manual and/or alignment procedure, shall not less than $43+10 \log$ (mean output power in watts) dBc below the mean power output outside a licensee's frequency block (-13dBm).

Method of Measurement: Spectrum Analyzer Settings:
 RBW: 100 kHz. As required for digital modulations.
 RBW: 1MHz. When frequency is located above 1GHz.
 VBW: \geq RBW
 Start Frequency: 9KHz or Lowest Clock Frequency
 Stop Frequency: 10 GHz (Cellular), 20GHz (PCS)
 Sweep: Auto
 Using in-band filter if needed.
 For Inter-modulation measurement: Three RF signals set as inputs. The frequencies of RF signals shall be within the repeater's operating band: two signals will close to each other at the lower band edge; the third will be close to upper band edge. The level of both RF input signals shall be increased, until the maximum rated output power per channel, as declared by the manufacturer (CDMA/WCDAM:40W & GSM/EDGE/TDMA:25W), is reached.

* Out of band plots show nearly identical noise floor readings for the frequency ranges below 1GHz.

Section 6. Field Strength of Spurious

Name of Test:	<i>Field Strength of Spurious</i>	Test Standard:	22.917 24.238
Tested By:	EDWARD LEE	Test Date:	04/29/2008-05/09/2008

Minimum Standard: Para. No. 22.917(e). The mean power of emissions must be attenuated below the mean power of the unmodulated carrier on any frequency twice or more than twice the fundamental emission by at least $43 + 10 \log P$. This is equivalent to -13 dBm absolute power. Para. No. 24.238(a). The magnitude of each spurious and harmonic emission that can be detected when the equipment is operated under conditions specified in the instruction manual and/or alignment procedure, shall not less than $43+10 \log$ (mean output power in watts) dBc below the mean power output outside a licensee's frequency block (-13dBm).

Method of Measurement: TIA/EIA-603-1992, Section 2.2.12
The antenna substitution method was used to determine the equivalent radiated power at spurious frequencies. The spurious emissions were measured at a distance of 3 meters. The EUT was then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna was fed with a signal at the spurious frequency. The level of the signal was adjusted to repeat the previously measured level. The resulting ERP is the signal level fed to the reference antenna corrected for gain referenced to a dipole.

Per FCC Requirements, the antenna substitution method can be replaced by using following calculation to yield the required limit criteria WHEN the max. level of measured spurious emissions is 30dB below the limit.

NOTE:

* Measured noise floor

SA: Spectrum Analyzer

SG: Signal Generator

CL: SMA cable loss (6ft)

H=horizontal and V=vertical

EIRP = SG reading - CL + Gain (dBi)

Margin = EIRP - Limit

Section 7. Frequency Stability

Name of Test:	<i>Frequency Stability</i>	Test Standard:	<i>2.1055 22.355&24.235</i>
Tested By:	WEI LI	Test Date:	04/29/2008-05/09/2008

Minimum Standard: Para. No. 22.355. The transmitter carrier frequency shall remain within the tolerances given in Table C-1.

TABLE C-1.—FREQUENCY TOLERANCE FOR TRANSMITTERS IN THE PUBLIC MOBILE SERVICES

Frequency range (MHz)	Base, fixed (ppm)	Mobile ≤3 watts (ppm)	Mobile ≤=3 watts (ppm)
25 to 50	20.0	20.0	50.0
50 to 450	5.0	5.0	50.0
450 to 512	2.5	5.0	5.0
821 to 896	1.5	2.5	2.5
928 to 929	5.0	n/a	n/a
929 to 960	1.5	n/a	n/a
2110 to 2220	10.0	n/a	n/a

Para No. 24.235. The frequency stability shall be sufficient to ensure that the fundamental emission stays within the authorized frequency block.

Method of Measurement: Frequency Stability With Voltage Variation:
 The E.U.T. is placed in an environmental chamber and allowed to stabilize at +25 degrees Celsius for at least 15 minutes. Set SA resolution bandwidth low enough (30Hz) to obtain the desired frequency resolution. (Using frequency counter method: The frequency counter and signal generator are phase locked with the same 10 MHz reference frequency by connecting the 10 MHz ref. out of the counter to the 10MHz ref, in of the signal generator). With the voltage input to the E.U.T. set to 85% S.T.V., the frequency is measured in 30 second intervals for a period of 5 minutes. This procedure is repeated at 100% S.T.V. and 115% S.T.V.

Frequency Stability With Temperature Variation:
 The input voltage to the E.U.T. is set to S.T.V. and the temperature of the environmental chamber is varied in 10 degree steps from -30 degrees C to +50 degrees C. The E.U.T. is allowed to stabilize at each temperature and the frequency is measured in 30 second intervals for a period of 5 minutes.

Test Result:

Complies
