

Spurious emissions (radiated) 9 kHz – 5 GHz
Spurious emissions (radiated) 9 kHz – 5 GHz

Standard:	ANSI C63.26-2015	
Tested by:	HEM	HEM
Date:	1 July 2023	2 July 2023
Temperature:	21 °C	20 °C
Humidity:	56 % RH	58 % RH
Barometric pressure:	997 hPa	991 hPa
Measurement uncertainty:	± 5.29 dB, level of confidence 95.45 % (k = 2)	
Test result:	PASS	

FCC Rule: §90.210
RSS-119 5.8

For transmitters that are not equipped with an audio low-pass filter. the power of any emission must be attenuated below the unmodulated carrier output power (P) as follows: on any frequency removed from the center of the authorized bandwidth by more than 250 percent of the authorized bandwidth; at least 43 + 10 log (P) dB.

For transmitters designed to operate with a 12.5 kHz channel bandwidth. any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows: on any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 12.5 kHz: at least 50 + 10 log (P) or 70 dB. whichever is the lesser attenuation.

Frequency Band (MHz)	Channel Bandwidth (kHz)	Authorized Bandwidth (kHz)	Limit (dBm)
406.1 - 470	12.5	11.25	-20
	25	20	-13

Test plan

The test was performed in a semi-anechoic chamber. The EUT was placed on a non-conductive table standing on a turntable. The distance between the EUT and the measurement antenna was 3 m. In order to find the maximum levels of the disturbance radiation the angle of the turntable. and the height of the measuring antenna were varied during the tests. The test was performed with the measurement antenna in both horizontal and vertical polarizations.

The EUT is tested in different combinations of channel bandwidth, TX frequency and EUT orientation. If emissions near the limit are detected with any combination, other combinations are investigated as well. The antenna connector was terminated with a 50 Ω load. The last number after the figure capitation indicates the EUT orientation (1=side towards the ground, 2=display towards the ground, 3=power connector downwards).

Test results

Frequency [MHz]	TX power [mW]	Ch. Width [kHz]	Modulation	Result
406.6 - 469.5	35000	12.5	GMSK 9600	PASS
406.6 - 469.5	35000	25.0	GMSK 19200	PASS

Frequency stability

Standard:	ANSI C63.26-2015		
Tested by:	HAM	HAM	HAM
Date:	10 July 2023	11 July 2023	12 July 2023
Temperature:	23 °C	22 °C	24 °C
Humidity:	39 % RH	42 % RH	44 % RH
Barometric pressure:	989 hPa	1005 hPa	1010 hPa
Measurement uncertainty:	± 0.470 dB (level of confidence 95.45 % (k = 2))		
Test result:	PASS		

FCC Rule: §90.213
RSS-119 5.3

Frequency stability is a measure of drift due to temperature and supply voltage variations. with reference to the frequency measured at an appropriate reference temperature and the rated supply voltage. The carrier frequency shall not depart from the nominal frequency in excess of the values specified for the equipment's frequency band:

Frequency Band (MHz)	Channel Bandwidth (kHz)	Frequency Stability (ppm)
406.1 - 470	12.5	± 2.5
	25.0	± 5

The test was performed with unmodulated carrier at maximum power level when possible. With low supply voltages the output power is restricted to 5 W.

The power levels more than 5 W requires supply voltage 12.0 to 30.0 VDC. Power levels 5 W or less operates also with voltage levels 9.0 to 11.00 VDC.

Test results channel width 12.5 kHz
Table 6: Frequency stability (normal temperature)

Transient frequency behaviour

Standard:	ANSI C63.26-2015	
Tested by:	HAM	HAM
Date:	4 July 2023	10 July 2023
Temperature:	25 °C	23 °C
Humidity:	42 % RH	39 % RH
Barometric pressure:	998 hPa	1021 hPa
Test result:	PASS	

FCC Rule: §90.214
RSS-119 5.9

When a transmitter is turned on or off, the radio frequency may take some time to stabilize. During this initial period, the frequency error or frequency difference (i.e., between the instantaneous and the steady state frequencies) shall not exceed the limits specified for the equipment's frequency band and channel bandwidth:

Channel Bandwidth (kHz)	Time Intervals	Maximum Frequency Difference (kHz)	Transient Duration Limit (ms)
12.5	t ₁	±12.5	10
	t ₂	±6.25	25
	t ₃	±12.5	10
25	t ₁	±25	10
	t ₂	±12.5	25
	t ₃	±25	10

- t_{on} is the instant when a 1 kHz test signal is completely suppressed, including any capture time due to phasing
- t₁ is the time period immediately following t_{on}
- t₂ is the time period immediately following t₁
- t₃ is the time period from the instant when the transmitter is turned off until t_{off}
- t_{off} is the instant when the 1 kHz test signal starts to rise

The test was performed with unmodulated carrier at maximum power level.
