RADIO FREQUENCY ADDENDUM EXPOSURE REPORT TO 95078-19

FOR THE

Device: 915 MHz Low Power RF Module Model: SP1ML-915

Report No.: 95078-19A

Date of issue: February 21, 2014

PREPARED FOR:

STMicroelectronics Centro Direzionale Colleoni Palazzo Andromeda 3 Agrate Brianza , 20041 Italy

PREPARED BY:

Eddie Wong CKC Laboratories, Inc. 5046 Sierra Pines Drive Mariposa, CA 95338

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

Steve Behm
Director of Quality Assurance & Engineering Services

CKC Laboratories, Inc.

Page 1 of 6 Report No: 95078-19A

Purpose:

To demonstrate compliance with United States RF Exposure requirements for Portable equipment (devices used ≤20cm from the body) or Mobile equipment (devices used >20cm from the body) with power output below exemption levels and Mobile equipment, where Maximum Permissible Exposure (MPE) Calculations apply.

Addendum A: Replaced 3.05 mW/cm2 with 4.8 mW EIRP on page 4...

United States Compliance Requirements (1.1310):

RF Exposure Evaluation Limits Occupational / Controlled Exposure

Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (A/m)	Power Density (mW/cm²)	Averaging Time (minutes)
0.3-3.0	614	1.63	*(100)	6
3.0-30	1842/f	4.89/f	*(900/f ²)	6
30-300	61.4	0.163	1	6
300-1500			f/300	6
1500-100,000			5.0	6

RF Exposure Evaluation Limits General Population / Uncontrolled Exposure

Concrete Constitution / Constitution Constit				
Frequency Range (MHz)	Electric Field Strength (V/m)	Magnetic Field Strength (A/m)	Power Density (mW/cm²)	Averaging Time (minutes)
0.3-1.34	614	1.63	*(100)	30
1.34-30	824/f	2.19/f	*(180/f ²)	30
30-300	27.5	0.073	0.2	30
300-1500			f/1500	30
1500-100,000			1.0	30

^{*} Plane wave equivalent power density

Limit is calculated based on the mid-band frequency used in the operating frequency range.

Exemption Level: Power output $<60/f_{GHz}$ (mW). For 915MHz = 65.6mW

Device and Antenna Operating Configuration:

Device operating at maximum output power with continuous transmission of modulated data.

EUT is transmitting at its rated maximum output power to an integral antenna.

Test Procedure:

This equipment is evaluated in accordance with the guidelines set forth in OET Guide 65 & ANSI C95.1 for the US.

Other Consideration

None			

MPE Calculations

Applicability:

Limit Used	X	General Population / Uncontrolled Exposure		
Littit Oseu	X	Occupational / Controlled Exposure		
RF Exposure Exemption	Yes	United States		

Equipment operational details:

Config #	Operating Frequency	Measured Output Power	Antenna Gain (dBi)	Antenna Type / Configuration	EIRP (dBm)
	(MHz)	(dBm)			
1	915	5.2	1.6	integral	6.8
2	903	4	1.6	integral	5.6
3	927	1.8	1.6	integral	3.4

Note: 5.2dBm = 3.3mW, 6.8dBm EIRP = 4.8 mW EIRP Measurements based from EMC Test Report(s): 95078-11

MPE Calculation:

Power Density =
$$\frac{EIRP}{4\pi d^2}$$
 Given: **EIRP** in mW or W and **d** in cm or m

		US (1.1310)		
Config	Distance	Power	Limit	
#	(cm)	Density	(mW/cm²)	
		(mW/cm²)		
1	20	Exempt		
2	20	Exempt		
3	20	Exempt		

Page 4 of 6 Report No: 95078-19A

Summary:

Exemptions:

In the case the equipment meets compliance requirements by exemption the product is approved for use under mobile or portable conditions without further testing under the condition that any additional collocation or simultaneous transmission requirements (including necessary separation distances) have been met.

MPE Calculation Results:

In the case the equipment meets compliance by MPE Calculations the product is approved for use under mobile conditions without further testing under the condition that any additional collocation or simultaneous transmission requirements (including necessary separation distances) have been met. It is assumed that the manufacturer shall design the equipment such that the minimum separation distance of 20cm (or greater, as listed above) is met or that the manufacturer provides a protection guide (or installation instructions) to the end user such that the antenna(s) may be installed in accordance with the manufacturer's instructions in such a manor to maintain the minimum separation distance.

The Absorption and distribution of Electromagnetic energy in the body is a very complex phenomena that depends on the mass, shape and physiological condition of the body; the orientation of the body with respect to the fields; and, the electrical properties of the body and the environment. Variables that may play a substantial role in possible biological effects are those that characterize the environment (including but not limited to: ambient temperature, air velocity, relative humidity and body insulation); and those that characterize the individual (including but not limited to: age, gender, activity level and existing debilitation or disease). Because innumerable factors may interact to determine specific biological effects of exposure to electromagnetic fields, any protection guide should consider both intended and unintended operational environments and provide guidance for installation and use of the product such that proper separation distances can be maintained. (ANSI C95.1)
