Date: 7.MAY.2007 13:53:51

$T_{ON}$  : 220  $\mu$ s  
 $T_{ON} + T_{OFF}$  : 9.958 ms

$$\text{Duty Cycle} = T_{ON} / (T_{ON} + T_{OFF}) \times 100\% = 0.22 / 9.958 \times 100\% = 2.21\%$$

Transmission-on-time within 100 milliseconds period:  $T = 2.21$  ms

$$\text{Duty Cycle Correction} = 20 \log_{10}(T / 100\text{ms}) = 20 \log_{10}(2.21 \text{ ms} / 100 \text{ ms}) = -33.11 \text{ dB}$$

**Delta Marker Measurement for 2.4835MHz Band Edge**

Measured Field Strength for High Channel in 1MHz RBW = 109.3 dB $\mu$ V/m

Delta Marker = -42.37 dB

Therefore, Peak Field Strength =  $109.3 \text{ dB}\mu\text{V/m} - 42.37 \text{ dB} = 66.93 \text{ dB}\mu\text{V/m}$

Limit = 74 dB $\mu$ V/m

Average Field Strength =  $66.93 \text{ dB}\mu\text{V/m} - 33.11 \text{ dB}(\text{Duty Cycle}) = 33.82 \text{ dB}\mu\text{V/m}$

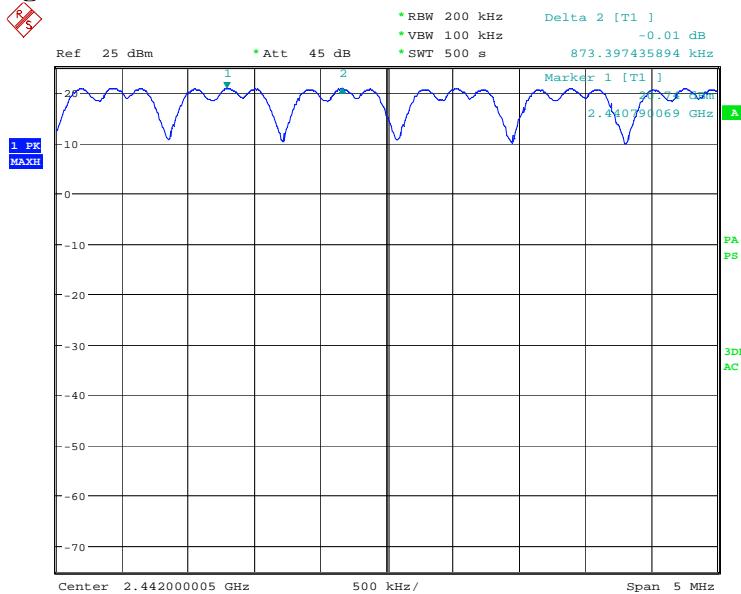

Limit = 54 dB $\mu$ V/m

**Clause 15.247(a)(1) Frequency hopping systems**

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater. Alternatively, frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a pseudo randomly ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).
