

# Antenna Test Report

June 5, 2024

|                      |  |
|----------------------|--|
| FCC ID:              | SBVRM045   |
| IC:                  | 5373A-RM045  |
| Model:               | S45  |
| Product Description: | Radio 0: 802.11 a/ac/ax/b/g/n Client Device with BT and BLE<br>Radio 1: 802.11 a/ac/ax/n Master Device |
| Test Engineer:       | Gregory Best   |
| Test Dates:          | Jan 22 – Feb 9, 2024   |

## 1. Measurement Method

Antenna Measurements in Anechoic Chambers The influence of atmospheric conditions and surrounding objects are non-ideal for accurate antenna measurements. An anechoic chamber offers a non-reflective, no-echo room for performing the antenna measurements. The anechoic chamber can simulate outer space, which is the most ideal location for antenna measurements. All gain measurements were performed in accordance with IEEE Std. 149 (IEEE Standard Procedures for Antenna Measurements). Losses of any test test cables were calibrated out post-measurement. Please refer to Figure 1 as the measurement chamber diagram.

1. Perform chamber calibration using reference antennas
2. Center the EUT in the chamber using the laser alignment system.
3. Connect the antenna micro-coax cable to the mast cable.
4. Capture antenna gain pattern using the automated measurement software.
5. Export the measurement data.
6. De-embed any additional cable losses in the setup (i.e., losses of any test cables that are not present in the actual product assembly).
7. Post-process measured data to extract the peak gain per antenna (take the maximum of the measured individual antenna pattern).
8. Combine antenna patterns per spatial point using the equations below (provided in KDB 662911, details outline in approved PAG submission) for correlated and uncorrelated gains, respectively

$$\text{Directional gain} = 10 \log[(10^{G_1/20} + 10^{G_2/20} + \dots + 10^{G_N/20})^2 / N_{\text{ANT}}] \text{ dBi}$$

Eq 1. Correlated Directional Gain Calculation

$$\text{Directional gain} = 10 \log[(10^{G_1/10} + 10^{G_2/10} + \dots + 10^{G_N/10}) / N_{\text{ANT}}] \text{ dBi}$$

Eq 2. Uncorrelated Directional Gain Calculation

9. Take the maximum of the combined directional gain pattern.

Example Math for ANT1 + ANT4 (at the spatial location where the highest combined gain occurs):

$$\text{Directional Gain} = 10 * \log((10^{(3.1/20)} + 10^{(1.4/20)})^2 / 2) \text{ dBi} = 5.3 \text{ dBi}$$

## 2. Antenna Information

| Antenna Designation | Sonos P/N | Band of Operation | Description                                   |
|---------------------|-----------|-------------------|---|
| ANT1                | 105-00290 | 2.4, 5 & 6 GHz    | Tri-band Monopole with coax cable, WLAN       |
| ANT2                | 105-00289 | 2.4, 5 & 6 GHz    | Tri-band Monopole with coax cable, WLAN       |
| ANT3                | 105-00288 | 2.4, 5 & 6 GHz    | Tri-band Monopole with coax cable, WLAN       |
| ANT4                | 105-00291 | 2.4, 5 & 6 GHz    | Tri-band Monopole with coax cable, WLAN       |
| ANTF0               | 105-00294 | 5 & 6 GHz         | Dual band Monopole with coax cable, WLAN      |
| ANTF1               | 105-00292 | 2.4, 5 & 6 GHz    | Tri-band Dipole with coax cable, WLAN, BT/BLE |
| ANTF2               | 105-00293 | 5 & 6 GHz         | Dual band Monopole with coax cable, WLAN      |

## Test Location

Sonos Antenna Chamber, 2 Avenue de Lafayette, Boston, MA 02111 USA.

Peak Gain was measured using the antenna test chamber. The antennas for S45 were measured in the full product assembly.

Figure 2.EUT placed inside the test chamber
