

## TAG MARKING

### 1 DEFINITION

Each module is individually marked with the unique Serial Number (SN) programmed in the NFC device. All the marking (described in Figure 5) are done by laser marking.

The SN is marked with a Data-Matrix Code (DMC) containing the same numerical information as the serial number present on the JSON format file within the NDEF file of the NFC device. The same numerical information is marked below the data-matrix information in a human-readable way (9 characters – 0 to 9 – split in 3 groups of 3 characters).
