

## **Response to TCB Findings**

The board that the transmitter sits on appears to have an RJ type connector. Has this port been populated during test? Please clarify.

No. It isn't used during normal operation.

The antenna has an extension cable that connects it to the antenna port on the Tx board. Is this cable permanently attached to the antenna or does it connect through another connector?

The antenna's extension cable does connect to the TX board by way of Reverse SMA, and the other end is permanently attached to the antenna.
