1 Scope

This documents describes both the normal RTX Mars protocol.

2 Introduction

The Mars system is based on DECT the ETSI standard ETS-300-175-1 to ETS-300-175-9. The Mars system is improved by implementing extra features to combat the interference at 2.4 GHz.

The frequency hopping method for 2.4 GHz ISM band has to provide optimal performance and connection quality in environment with 5 different types of interference:

1. Other interference of MARS-type, known hopping algorithm and avoidance method (synchronized/unsynchronized).
2. Microwave ovens, sweeping the most of the band and running on 60Hz mains supply.
3. Interference on fixed RF carrier, CW interference. Direct sequence CDMA is also detected as this type of interference.
4. Other hoppers using the ISM band, with unknown hopping algorithm, example: Wireless LAN based on IEEE802.11, etc.
5. "Range / multi-path propagation"

The frame format is based on DECT half bit rate and modified from 24 timeslots to 8 timeslots and 95 possible RF carriers. Frequency hopping is implemented on a frame by frame basis. The system is implemented with encryption based on DECT.

3 Avoidance method

3.1 Known hoppers

Use 95 RF channels. Re-map though hopping table. Part of RFPI/RPN defines which hopping sequence to use. Bearer hand-over: change of slot-position and hopping index. Avoid modulo 16 sequences (= DECT sequences).

Different connection/bearer should use different hopping index.

3.2 Microwave ovens

Use dual slot diversity. Transmission of same B-field content in two slots on different carrier. Normal one frame delay extended to two frames delay in each direction in order to ensure seamless selection of best received burst. Total extra round-trip delay is two extra frames.

3.3 CW interference on fixed RF carriers

Exclude discrete RF carriers and adaptive use of dual-slot diversity.

3.4 Other hoppers

Appears like random interference. Adaptive usage of dual-slot diversity.

| | | | |
|---|-------------------|-------------------------|--------------|

| File: FCC description 2G4 (Ver2.0)cvm.doc | | Ref.: JTP/FM | Page: 3 of 9 |

3.5 Improve range / multi-path performance

Use prolonged preamble for antenna diversity in handset.

4 Adaptation to 2.4GHz ISM band

4.1 Frame format:

Down-link (FP to PP) Up-link (PP to FP)

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|

length 10 ms

4.1.1 Crystal frequency 10.368000 MHz

Symbol rate: 576 kbit/sec.

Frame length: 8 timeslots, same as 10 ms.

Frame frequency: 100 Hz

Number of symbols for frame: 5760

Number of symbols per slot: 720 (440 in burst and 280 in guard space)

4.1.2 Frequency hopping

Slots are used in pairs for duplex bearers (0,4), (1,5), etc. The FP transmit on a frequency in a slot-pair, and the PP responds on the same carrier in the up-link direction. Handset uses preamble antenna diversity to detect the best antenna for reception/transmission.

| Frame | Frequency versus slot | | | | | | | |
|-------|-----------------------|--|---|--|---|--|---|--|
| N | x | | y | | x | | y | |
| N+1 | z | | w | | z | | w | |
| N+2 | v | | t | | v | | t | |

4.2 Burst format:

| | | | | |
|------------|---------|---------|----|-------------|
| Sync field | A field | B field | XZ | Guard space |
|------------|---------|---------|----|-------------|

4.2.1 Sync-field

Length: 48 symbols consisting of

Prolonged preamble: 16 bit data (1010b sequence)

Preamble for bit-synchronization: 16 bit data (1010b sequence)

Frame synchronization word: FP: E98Ah (1110 1001 1000 1010b sequence)

PP: 1675h (0001 0110 0111 0101b sequence)

| | | | |
|---|-------------------|-------------------------|--------------|
| Date: 26-Apr-2004 | Project name: CVM | Technical Documentation | |
| File: FCC description 2G4 (Ver2.0)cvm.doc | | Ref.: JTP/FM | Page: 4 of 9 |

4.2.2 A-field

Total length 64 symbols

Header: 8 bit

Tail: 40 bit

CRC: 16 bit

4.2.2.1 T-MUX:

NT: RFPI is normally broadcast 7 out of every 8 frames.

QT: Static system information

PT: Broadcast, paging

MT: MAC layer control

CT: Connection oriented higher layer signaling

4.2.2.2 Derive hopping SequenceCode (SQC) from RFPI

In order to distribute usage of different hopping sequences, the actual used sequence is derived from the FP identity, RFPI. The RFPI is normally broadcast 7 out of every 8 frames which then allows immediate recognition of hopping sequence by the PP during the initial synchronization.

The RFPI consists of 40 bits (5 bytes):

The SQC is located from bit a40 to a44.

4.2.2.3 Excluding fixed carriers.

List of excluded RF carriers or parts hereof is broadcast using paging (reserved code 3).

The method is defined:

PT₃ (1): *ExcpPattern0*[32] (32 bits used)

PT₃ (2): *ExcpPattern1*[32] (32 bits used)

PT₃ (3): *ExcpPattern2*[15] (31 bits used)

ExcpPatternx describes a complete pattern of excluded RF carriers (If a bit is set the carrier is excluded).

4.2.3 B-field

Format and usage of B-field is similar to DECT. 320 bits of ADPCM data.

| | | | |
|---|-------------------|-------------------------|--------------|
| Date: 26-Apr-2004 | Project name: CVM | Technical Documentation | |
| File: FCC description 2G4 (Ver2.0)cvm.doc | | Ref.: JTP/FM | Page: 5 of 9 |

4.2.4 XZ-field

Format and usage of XZ-field is similar to DECT. X-field is a 4-bit CRC on the B-field content. Z-field is a copy of the X field and is used to detect sliding collision.

4.3 Frequency hopping algorithm

The number of used frequencies (NUF) in the hopping algorithm is 95.

In FP and PP exists a PrimaryHoppingIndexNumber (PHIN). This number is incremented modulo NUF in the end of the normal downlink half-frame. It is broadcast in Q0 message instead of PSCN.

To a simplex or an established duplex bearer is assigned a HoppingIndexOffset (HIO), which is analogue to the used RF carrier in a FDMA system. This value is broadcast in place of CN in Q0 message. In the FP in all unused slots in up-link direction the receiver is scanning with HIO=0. The receiver scanning doesn't exclude RF-carriers.

Different FPs use different hopping sequences. The different sequences are derived from the hopping table by adding an offset, SequenceCode (SQC). See section 4.2.2.2.

A hopping table maps an index I to a carrier number: $CN = f(I)$

The physical RF carrier is calculated by the formula:

$$CN = (f ((PHIN+HIO) \bmod NUF) + SQC) \bmod NUF$$

4.3.1 Excluded carriers

Excluded carriers (exceptions) are fixed carriers that constantly are interfered by CW RF-carrier. The decision for excluding a RF carrier, are based on:

- RSSI monitor during scanning in the FP.
- Bearer quality in FP correlated to specific RF-carriers.
- Bearer quality detected in PP and reported using Q1 in MAC-header.

When exception carriers are included the complete algorithm is:

```

I = (PHIN+HIO) mod NUF
CN = ( f (I) + SQC ) mod NUF
While CN in ExclusionList
{
  I = (I + FreqHopIndexExcpShift) mod NUF
  CN = ( f (I) + SQC ) mod NUF
}

```

where $\text{FreqHopIndexExcpShift} = (\text{NUF}-1)$.

4.3.2 Hopping tables

4.3.2.1 Hopping sequence for North America and most of Europe

For 10.368000 MHz crystal the frequencies are derived as:

Frequency: 2401.056 MHz + CN * 0.864000 MHz

| i | f(I) | I | f(i) | i | f(i) | i | f(i) | i | f(i) |
|----|------|----|------|----|------|----|------|----|------|
| 0 | 0 | 20 | 2 | 40 | 27 | 60 | 13 | 80 | 40 |
| 1 | 23 | 21 | 18 | 41 | 12 | 61 | 33 | 81 | 1 |
| 2 | 62 | 22 | 81 | 42 | 89 | 62 | 65 | 82 | 28 |
| 3 | 8 | 23 | 11 | 43 | 25 | 63 | 50 | 83 | 55 |
| 4 | 43 | 24 | 36 | 44 | 87 | 64 | 79 | 84 | 35 |
| 5 | 16 | 25 | 72 | 45 | 14 | 65 | 56 | 85 | 53 |
| 6 | 71 | 26 | 54 | 46 | 57 | 66 | 91 | 86 | 24 |
| 7 | 47 | 27 | 69 | 47 | 41 | 67 | 42 | 87 | 44 |
| 8 | 19 | 28 | 21 | 48 | 74 | 68 | 80 | 88 | 82 |
| 9 | 61 | 29 | 3 | 49 | 32 | 69 | 48 | 89 | 51 |
| 10 | 76 | 30 | 37 | 50 | 70 | 70 | 15 | 90 | 90 |
| 11 | 29 | 31 | 10 | 51 | 9 | 71 | 85 | 91 | 38 |
| 12 | 59 | 32 | 34 | 52 | 58 | 72 | 5 | 92 | 83 |
| 13 | 22 | 33 | 66 | 53 | 78 | 73 | 88 | 93 | 30 |
| 14 | 52 | 34 | 7 | 54 | 45 | 74 | 17 | 94 | 46 |
| 15 | 86 | 35 | 68 | 55 | 20 | 75 | 84 | | |
| 16 | 63 | 36 | 94 | 56 | 73 | 76 | 6 | | |
| 17 | 26 | 37 | 75 | 57 | 93 | 77 | 67 | | |
| 18 | 77 | 38 | 4 | 58 | 64 | 78 | 49 | | |
| 19 | 31 | 39 | 60 | 59 | 39 | 79 | 92 | | |

4.4 PP synchronization procedure

PP selects a random RF carrier and tries to receive a frame within 0.9 sec. If nothing is received then a new RF carrier is selected.

When a burst with correct A-CRC is received and it is a Nt (RFPI) the hopping sequence (SQC) is known and the PP must receive in the following frames using the hopping sequence. If the received A-field is different from a Nt, the PP selects a new RF carrier randomly and waits for Nt. In this state the PP do not have information of excluded RF carriers, but just follows the known hopping sequence without excluding any RF carriers. Only individual frames are missed on the excluded carriers. When PT3 is received, the PP is able to receive on exception carriers.

|---|-------------------|---------------------------|
| Date: 26-Apr-2004 | Project name: CVM | Technical Documentation |
| File: FCC description 2G4 (Ver2.0)cvm.doc | | Ref.: JTP/FM Page: 7 of 9 |

4.5 Dual slot diversity

Dual slot diversity is activated in case interference is detected. That is, two bearers are active, carrying the same B-field content. The receiver decides which of the received speech frames to use, depending on A-CRC and/or X-CRC. The setup and release of the 2nd bearer are performed dynamically by the FP-MAC and PP-MAC to adapt to current interference level. The two bearers are managed independently in the MAC, like a stalled intra-cell bearer hand-over with two established bearers. HoppingIndexOffset (HIO) for the two bearers are selected independently.

4.6 Power amplifier activation

4.6.1 External connection

The FP has one connection active at all times to make synchronization of the PP possible. In case a speech connection is active one slot will be active in down-link direction and one slot will be active from in up-link direction. The power amplifier will be active from start of sync field to the end of XZ field, which is slightly less than 1/12 of the total frame. In case dual slot diversity is active, two slots will be active equal to 2/12 of a frame.

4.6.2 Internal connection

Two handsets are able to make an internal connection. In this case two bearers will be active in the down-link direction from FP, and one bearer will be active from each handset. The two bearers in down-link direction are not correlated and uses different HoppingIndexOffset. Dual slot diversity is activated independently towards each handset, i.e. up to four bearers may be activated in down-link direction, and two bearer may be active in up-link direction.
