1. EUT Description and operation

1.1. General description:

* Note: All information in below clause was supplied by the customer.

Description of Equipment Under Test (EUT): MedicGate
Model: VMG02 (915 MHz)
Manufactured by: Medic4All (Israel) Ltd.

The VMG02 is a medical gateway which communicates with the medical center (voice and data) via the telephone line and communicates with Medic4All peripheral devices via RF protocol.

Tested model has carrier frequency 915 MHz.

The EUT is Transceiver based on chipset Chipcon CC1020.
The transceiver uses one channel.
Antenna type – whip antenna.

Output transmission power: -1 dBm (EIRP)
Bandwidth: 50 kHz
Modulation type: FSK.

The EUT"s dimensions: 18cm x 14.5cm x 5cm.

The EUT's power source: 120 VAC/ 9 VDC Power Adapter, mfr MW comp., Model PSU15A-2.

The EUT's block diagram and Tx-RX block diagram are shown in Figures 1 and 2, respectively.
The EUT's general views are presented in Photos 2-5.

2	Audio out	RCA	Shielded	1
3	Telephone	RJ-11	unshielded	4
4	RS232	RJ-45	unshielded	2

1.3. Potential emission sources:

The potential emission sources are detailed in Table 2.

Table 2. Potential emission sources

Frequency	Location
14.7456 MHz (crystal)	VMG02
8.000 MHz (crystal)	VMG02
4.9152 MHz	VMG02
4.194304 MHz	VMG02
915 MHz(RF signal)	VMG02

1.4. EUT setup and operation:

EUT was [placed on a table, supplied from 120 VAC /9 VDC Adapter.
Respective tests were performed in Transmission (Tx) and Receiving (Rx) modes.

2. Measurements, examinations and derived results

2.1. Location of the Test Site:

Preliminary radiated test and immunity tests were conducted at the EMC laboratory of the Standards Institution of Israel in Tel-Aviv.

All other tests were conducted in an Open Area Test Site located at Kibbutz Native Halamed Hai in Emek HaEla, Israel.

2.2. Test condition:

Temperature: 22 °C. Humidity: 56 %. Atmospheric pressure: 1010 mbar.

2.3. Initial visual check and functional test:

Initial visual check and brief built- in- test of the EUT was performed before testing.

- No external damages were found. The test on the EUT passed successfully.

2.4. Emission tests:

- For both radiated and conducted measurements, initial scans were made using a peak detector but still using the appropriate CISPR 16 (Quasi-Peak) detector IF bandwidth.
- For conducted emissions, a tolerance limit was set 6 dB below the specification limit. Levels above the tolerance limit were retested using the Quasi-Peak detector or an average detector.
- For radiated emissions, a tolerance limit was set 10 dB below the specification limit. Levels above the tolerance limit were retested using the Quasi-Peak detector.
- Unless otherwise stated, the plots shown in Clause 2.5.4 are all from scans where a peak detector was used.
- If the result with a Quasi-Peak detector exceeds the specification limit, it is marked with “Fails” in the margin, if it is within the limits of uncertainty for the measurement, it is marked with a “*”.

2.5. Conducted emission test:

2.5.1. General:

Per FCC Part 15 Subpart B Section 15.107 / Subpart C Section 15.207.

2.5.2. Test Configuration:

The EUT was arranged a non-metallic table in a shielded chamber at a height of 80 cm from the floor of the shielded chamber and 40 cm from the vertical ground plane of the tested chamber.

Line subjected to test: 120 VAC mains to Adapter.

2.5.3. Test Procedure:

The EUT was operated according to clause 1.4.

First, initial scan were performed. Final measurements were performed for emission, which exceeded the tolerance limit.

Test equipment (EMI receiver) setup was as follow:

Initial scan:	
Detector type	Peak
Mode	Max hold
Bandwidth	9 kHz
Step size	Continuous sweep
Sweep time	>100 msec

Measurements:	
Detector type	Quasi-peak (CISPR)
Bandwidth	9 kHz
Measurement time	200 seconds/MHz
Observation	>15 seconds

2.5.4. Test results:

All received emissions from EUT were found below respective FCC limits.

Worst result recorded on Phase line at 0.6 MHz with QP detector was found to 5.4 dB below FCC Subpart B Section 15.107 Class B AVG limit / Subpart C Section 15.207 AVG limit.

Test results and plots are presented below.

2.6. Radiated emission test:

2.6.1. General:

Per FCC Part 15 Subpart B Section 15.109 / Subpart C Section 15.209.

2.6.2. Preliminary radiated emission tests:

Preliminary radiated measurements were performed in a semi-anechoic chamber at a distance of 3 meters. The EUT was setup in its typical configuration and operated in Rx mode.

The frequency spectrum was monitored. EUT configuration, cable configuration and mode of operation, which produced the maximum level of emission, were documented. A list of frequencies to be tested was prepared.

2.6.3. Final measurements:

The final radiated measurements were performed at the Open Area Test Site.
The EUT was operated as described in clause 1.4.

The EUT was installed on a turn- table. Photos of test setup are presented Appendix 3.

All measurements at the Open Area Test Site were performed at a 10 m measurement distance. The Biconilog 30 MHz-2 GHz antenna was used.

The EUT's configuration and mode of operation, which produced the maximum level of emissions, were selected.

The Frequency range from 30 to 1000 MHz was investigated.
The measurements were performed at each frequency found previously and at frequencies at which the signal was 10 dB below the limit or less.

All measurements at the Open Area Test Site were performed at a 10 m measurement distance from the EUT.

The levels were maximized by initially rotating turntable through 360°, varying the antenna height between 1 m and 4 m, rerouting EUT cables and changing antenna-to-EUT polarization from vertical to horizontal.

Unless stated otherwise, the measuring equipment settings were:

Initial scan:	
Detector type	Peak
Mode	Max hold
Bandwidth	120 kHz
Step size	Continuous sweep
Sweep time	>1 seconds/MHz

Measurements:	
Detector type	Quasi-peak (CISPR)
Bandwidth	120 kHz
Measurement time	20 seconds/MHz
Observation	>15 seconds

2.6.4. Radiated emission test results:

Test results are presented in Table 3.

Note 1: Emission level = E Reading (dBμV) + Cable loss (dB) + Antenna Factor (dB/m)
For Cable Loss and Antenna Factor refer to Appendix 2.

Note 2: The measurements were performed at 10 m distance and the results were extrapolated to 3 m distance.

2.7. Test of field strength of emission from intentional radiators

2.7.1. General:

Per FCC Part 15 Subpart C Clauses 15.249 (a) and 15.205.

2.7.2. Requirements:

The EUT's operation frequency is within the bands 902 – 928 MHz.
The field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following limits that presented in table below:
.

Fundamental Frequency	Limit of Field Strength of Fundamental (millivolts/ meter)	Calculated limit Field Strength of Fundamental dBμV/m, @ 3 m	Limit of Field Strength of Harmonics (microvolts/ meter)	Calculated limit Field Strength of Harmonics dBμV/m, @3 m
902 – 928 MHz	50	94	500	54

Note: Peak field strength of Harmonics not exceed the maximum permitted AVG specified limit above by more than 20 dB.

2.7.3. Test procedure:

The test was conducted according to clause 15.249 (a).
The measurements were conducted at the normal conditions.
The Fundamental frequency was recorded (see Plot # 3).

The measurements (spurious emission) were performed in Tx mode in the frequency rage from 30 MHz to 6500 MHz (with detector QP – below 1000 MHz and AVG detector – above 1000 MHz).

Test of range of modulation bandwidth (20 dB) was performed for information only (see Plot # 10).

2.7.4. Test results:

Recorded Fundamental frequency was 93.55 dBμV/m (see Plot # 3).
The result was found below specified limit.

Spurious emission test results are shown in table below (worst case results were recorded) and in Plots #4-#6 (for Tx mode) and Plots #7- #8 (for Rx mode).
