

## **SI-LINK QUICK START GUIDE**

- 1.** Select an FM bandwidth on your car radio between 88Khz-89.5 KHz that has a weak or no radio station.
- 2.** Plug your SI-Link into your portable player. Turn both the portable player to the on- "play" position and turn your SI-Link on. Fine tune your link using the signal adjustment dial. Adjust the dial until the music from your portable sound source, hooked to your SI-Link, is clear and stable through your car radio.
- 3.** In some high FM radio band traffic areas you may hear some minor interferences while driving. This is due to the fact that the radio signal at the selected bandwidth is stronger in that specific area. It may clear up in a short drive distance or you may need to re-tune your SI-Link slightly or select another bandwidth by repeating step 1.

### **Caution:**

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment. Please revise the user manual accordingly.
