Test of Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)

To: FCC 47 CFR Part 15.407 & IC RSS-210

Test Report Serial No.: XIRR04-U8 Rev A

### Test of Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)

to

### To FCC 47 CFR Part 15.407 & IC RSS-210

Test Report Serial No.: XIRR04-U8 Rev A

<u>Note:</u> this report contains data with regard to the 5,250 – 5,350 and 5,470 – 5725 MHz bands for Xirrus Inc., XI-AC1300 Wireless module. 2.4, 5.8 GHz test data are reported in MiCOM Labs test report XIRR04-U3. 5.15 – 5.25 GHz reported in MiCOM Labs test report XIRR04-U6

This report supersedes None

Applicant: Xirrus Inc. 2101 Corporate Center Drive Thousand Oaks California 91320, USA

Product Function: Wireless Access Point

### **ACCREDITATION, LISTINGS & RECOGNITION**

### **TESTING ACCREDITATION**

MiCOM Labs, Inc. is an accredited Electrical testing laboratory per the international standard EN ISO/IEC 17025. The company is accredited by the American Association for Laboratory Accreditation (A2LA) <u>www.a2la.org</u> test laboratory number 2381.01. MiCOM Labs test schedule is available at the following URL; <u>http://www.a2la.org/scopepdf/2381-01.pdf</u>

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### STANDARD(S)

FCC 47 CFR Part 15.407 & IC RSS-210 (Limited to DFS Bands)

**TEST RESULTS** 

EQUIPMENT COMPLIES

MiCOM Labs, Inc. tested the equipment mentioned in accordance with the requirements set forth in the above standards. Test results indicate that the equipment tested is capable of demonstrating compliance with the requirements as documented within this report.

### Notes:

- 1. This document reports conditions under which testing was conducted and the results of testing performed.
- Details of test methods used have been recorded and kept on file by the laboratory.
- 3. Test results apply only to the item(s) tested.

### Approved & Released for MiCOM Labs, Inc. by:

Graeme Grieve Quality Manager MiCOM Labs,

TESTING CERT #2381.01

ordon Hurst resident & CEO MiCOM Labs, Inc.

### 2.2. Test and Uncertainty Procedures

Conducted and radiated emission measurements were conducted in accordance with American National Standards Institute ANSI C63.4, listed in the Normative References section of this report.

Measurement uncertainty figures are calculated in accordance with ETSI TR 100 028 Parts 1 and 2.

Measurement uncertainties stated are based on a standard uncertainty multiplied by a coverage factor k = 2, providing a level of confidence of approximately 95 % in accordance with UKAS document M 3003 listed in the Normative References section of this report.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### 3.2. Scope of Test Program

### Xirrus Inc. RF Module

The scope of the test program was to test the Xirrus Inc. Wireless LAN module, 3x3, and 2x2 Spatial Multiplexing MIMO configurations in the frequency range 5,250 to 5,350 and 5,470 – 5725 MHz for compliance against FCC 47 CFR Part 15.407 and Industry Canada RSS-210 specifications.

The client requested that both the XI-AC1300 and XI-AC867 be treated as an SDR (Software Defined Radio)

3x3 Module: XI-AC1300 2x2 Module: XI-AC867

### **Module Differences**

Client stated that the module differences between the 3x3 and 2x2 is that the 2x2 has the third antenna trace terminated with no access. As a result the test strategy determined full testing performed on the 3x3 module and limited testing on the 2x2. The output power on the 2x2 module was limited to approximately the same power that was observed on Ports a and b on the 3x3 module. This implies the maximum EIRP is less for the 2x2.

### FCC OET KDB Implementation

This test program implements the following FCC KDB – 662911 4/4/2011; *Emissions Testing of Transmitters with Multiple Outputs in the Same Band* 

The KDB document provides guidance for measurements of conducted output emissions of devices that employ a single transmitter with multiple outputs in the same band, with the outputs occupying the same or overlapping frequency ranges. It applies to EMC compliance measurements on devices that transmit on multiple antennas simultaneously in the same or overlapping frequency ranges through a coordinated process. Examples include, but are not limited to, devices employing beam forming or multiple-input and multiple-output (MIMO.) This guidance applies to both licensed and unlicensed devices wherever the FCC rules call for conducted output measurements. Guidance is provided for in-band, out-of-band and spurious emission measurements.

This guidance does not apply to the multiple transmitters included in a composite device, such as a device that combines an 802.11 modem with a cell phone in one enclosure with each driving its own antenna.

### 3.6. Test Configurations

Testing was performed to determine the highest power level versus bit rate. The variant with the highest power was used to exercise the product.

Matrix of test configurations

| Operational Mode(s)<br>(802.11) | Variant | Data Rates with Highest<br>Power | Frequencies<br>(MHz) |
|---------------------------------|---------|----------------------------------|----------------------|
|                                 | Legacy  | 6 MBit/s                         | 5180 / 5200 / 5240   |
| a,n                             | HT-20   | 6.5 MBit/s (MCS 0)               |                      |
|                                 | HT-40   | 13.5 MBit/s (MCS 0)              | 5190 / 5230          |
| ac                              | ac-80   | 29.3 MBit/s (MCS 0)              | 5210                 |

### Antenna Test Configurations for Radiated Emissions and Band-Edge

The following measurements were performed on all antenna configurations identified in Section 3.4 Antenna Details.

### Spurious Emission and Band-Edge Test Strategy Bands 5,150 – 5250

| 11a     | 11n HT-20 | 11n HT-40 | 11ac-80 |
|---------|-----------|-----------|---------|
| BE 5180 | BE 5180   | BE 5190   | BE 5210 |
| SE 5180 |           |           |         |
| SE 5200 |           |           |         |
| SE 5240 |           |           |         |

KEY:-

SE – Spurious Emissions

BE – Band-Edge

### 3.7. Equipment Modifications

The following modifications were required to bring the equipment into compliance:

1. NONE

### 3.8. Deviations from the Test Standard

The following deviations from the test standard were required in order to complete the test program:

1. NONE

### 3.9. Subcontracted Testing or Third Party Data

1. NONE

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:22 of 492

### 4. TESTING EQUIPMENT CONFIGURATION(S)

### 4.1. Conducted RF Emission Test Set-up

The following tests were performed using the conducted test set-up shown in the diagram below.

- 1. Section 6.1.1.1. 26 dB and 99% Bandwidth
- 2. Section 6.1.1.2. Maximum Conducted Output Power
- 3. Section 6.1.1.3. Peak Power Spectral Density
- 4. Section 6.1.1.4. Peak Excursion Ratio

### **Measurement and Presentation of Test Data**

The measurement and graphical data presented in this test report was generated automatically using state-of-the-art technology creating an easy to read report structure. Numerical measurement data is separated from supporting graphical data (plots) through hyperlinks. Numerical measurement data can be reviewed without scrolling through numerous graphical pages to arrive at the next data matrix.

Plots have been relegated into the Appendix 'Graphical Data'.

Test and report automation was performed by <u>MiTest</u>. <u>MiTest</u> is an automated test system developed by MiCOM Labs. <u>MiTest</u> is the first cloud based modular test system enabling end-to-end automation of regulatory compliance testing for conducted RF testing.

The MiCOM Labs "*MiTest*" Automated Test System" (Patent Pending)

### 4.2. Radiated Spurious Emission Test Set-up > 1 GHz

The following tests were performed using the radiated test set-up shown in the diagram below.

1. Section 6.1.2.1

### Radiated Emission Measurement Setup – Above 1 GHz

### Traceability

 Test Equipment Utilized for Radiated Emission Testing > 1GHz

 158, 252, 310, 312, 377, 393, 396, 399, 406, 411, 413, 415, 416, 502, 503

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### 4.3. Digital Emissions Test Set-up (0.03 – 1 GHz)

The following tests were performed using the radiated test set-up shown in the diagram below.

1. Section 6.1.2.3

### Digital Emission Measurement Setup – Below 1 GHz

### Traceability

 Test Equipment Utilized for Radiated Emission Testing 0.03 - 1GHz

### Test Procedure for 26 dB and 99% Bandwidth Measurement

The bandwidth at 26 dB and 99 % is measured with a spectrum analyzer connected to the antenna terminal, while EUT is operating in transmission mode at the appropriate center frequency. KDB 789033 Section 5.1 Emission Bandwidth was used in order to prove compliance. The Resolution Bandwidth was set to approximately 1% of the emission bandwidth.

#### Measurement Results for 26 dB and 99 % Operational Bandwidth(s)

#### Specification

Limits

FCC, Part 15 §15.407 (a)(1), (a)(2) and Industry Canada RSS-210 § A9.2(2)

(a)(1) For the band 5.15-5.25 GHz the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 50 mW or +4 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz. In addition, the peak power spectral density shall not exceed +4 dBm in any 1 megahertz band.

(a)(2) For the 5.25-5.35 GHz band the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 250 mW or +11 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz. In addition, the peak power spectral density shall not exceed +11 dBm in any 1 megahertz band.

#### Industry Canada RSS-Gen 4.4

When an occupied bandwidth value is not specified in the applicable RSS, the transmitted signal bandwidth to be reported is to be its 99% emission bandwidth, as calculated or measured.

#### Traceability

| Test Heading:  | Maximum Conducted Output<br>Power                     | Rel. Humidity (%):  | 32 - 45     |  |  |
| Standard Section(s):   | 15.407 (a)  | Pressure (mBars):   | 999 - 1001  |  |  |
| Reference Document(s):                                       | KDB 789033 - D01 DTS General UNII Test Procedures v01 |                     |             |  |  |

#### Test Procedure for Maximum Conducted Output Power Measurement

<u>Method PM (Measurement using an RF average power meter)</u>. Section C) 4) of KDB 789033 defines a methodology using an average wideband power meter. Measurements were made while the EUT was operating in a continuous transmission mode (100% duty cycle) at the appropriate center frequency. All cable losses and offsets were taken into consideration in the measured result. All operational modes and frequency bands were measured independently and the resultant  $\Box$  calculated. For multiple outputs, the measurements were made simultaneously on each output port and summed in a linear fashion. This technique was used in order to prove compliance.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

#### Antenna Beam and Non-Beam Forming Power Levels

15. 407 (a)(1), (a) (2) Operation with directional antenna gains greater than 6 dBi.

If transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi. Further FCC KDB 662911 D01 Multiple Transmitter Output v01 requires that the gain of antennas transmitting the same data (legacy 802.11a mode) must be increased by 10 \* Log (N) when N is the number of antenna elements.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

Maximum Transmit (Conducted) Power, FCC Limits and Industry Canada Limits

#### Bands 5150 – 5250 MHz

#### **FCC Limits**

Conducted Power Limit lesser of: 50 mW or 4 dBm + 10 log (B) dBm. B is the 26 dB emission bandwidth in MHz.

| Mode  | Frequency<br>Range<br>(MHz) | Minimum 26 dB<br>Bandwidth (MHz) | 4 + 10 Log (B)<br>(dBm) | Limit<br>(dBm) |
|-------|-----------------------------|----------------------------------|-------------------------|----------------|
| а     |                             | 23.848                           | +17.77                  | +17.00         |
| HT-20 |                             | 25.050                           | +17.99                  | +17.00         |
| HT-40 | 5150 – 5250                 | 41.683                           | +20.20                  | +17.00         |
| ac-80 |                             | 84.168                           | +23.25                  |                |

#### **Industry Canada Limits**

EIRP Limit 5150 – 5250 MHz: Lesser of 200 mW (+23 dBm) or 10 + 10 Log (B) dBm. B is the 99% emission bandwidth in MHz.

| Mode  | Frequency<br>Range<br>(MHz) | Minimum 99 %<br>Bandwidth (MHz) | 10 + 10 Log (B)<br>(dBm) | EIRP Limit<br>(dBm) |
|-------|-----------------------------|---------------------------------|--------------------------|---------------------|
| а     |                             | 16.834                          | +22.26                   | +22.26              |

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:68 of 492

#### Specification Limits

#### FCC, Part 15 §15.407 (a)(1), (a)(2) and Industry Canada RSS-210 § A9.2(2)

(a)(1) For the band 5.15-5.25 GHz the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 50 mW or +4 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz. In addition, the peak power spectral density shall not exceed +4 dBm in any 1 megahertz band.

(a)(2) For the 5.25-5.35 and 5470-5725 MHz GHz band the maximum conducted output power over the frequency band of operation shall not exceed the lesser of 250 mW or +11 dBm + 10 log B, where B is the 26 dB emission bandwidth in megahertz. In addition, the peak power spectral density shall not exceed +11 dBm in any 1 megahertz band.

#### Industry Canada RSS-210 §A9.2(2)

For the band 5150-5250 MHz, the maximum equivalent isotropically radiated power (e.i.r.p.) shall not exceed 200 mW or 10 + 10 log10 B, dBm, whichever power is less. B is the 99% emission bandwidth in MHz. The e.i.r.p. spectral density shall not exceed 10 dBm in any 1.0 MHz band.

For the band 5250-5350 MHz and 5470-5725 MHz, the maximum conducted output power shall not exceed 250 mW or 11 + 10 log10 B, dBm, whichever power is less. The power spectral density shall not exceed 11 dBm in any 1.0 MHz band. The maximum e.i.r.p. shall not exceed 1.0 W or 17 + 10 log10 B, dBm, whichever power is less. B is the 99% emission bandwidth in MHz.

#### Industry Canada RSS-Gen 4.4

When an occupied bandwidth value is not specified in the applicable RSS, the transmitted signal bandwidth to be reported is to be its 99% emission bandwidth, as calculated or measured.

#### Traceability

#### Test Procedure for Power Spectral Density

The In-Band power spectral density was measured using the measure and sum approach per FCC KDB 662911 (D01 Multiple Transmitter Output v01.)

<u>Measure and sum the spectra across the outputs</u>. With this technique, spectra are measured at each output of the device at the required resolution bandwidth. The individual spectra are then summed mathematically in linear power units. Unlike in-band power measurements, in which the sum involves a single measured value (output power) from each output, measurements for compliance with PSD limits involve summing entire spectra across corresponding frequency bins on the various outputs. Consistency is maintained for any device with N transmitter outputs to be certain the individual outputs are all aligned with the same span and same number of points. In this instance, the linear power spectrum value within the first spectral bin of output 1, and the first spectral bin of output 2, and so on up to the Nth output to obtain the true value for the first frequency bin of the summed spectrum. The summed spectrum value for each frequency bin is computed in this fashion. These summed spectral values were calculated on a computer, and the results read back into the spectrum analyzer as a data file to produce a representative plot of total spectral power density.

Calculated Power = A + 10 log (1/x) dBm

A = Total Power Spectral Density [10 Log10 ( $10^{a/10} + 10^{b/10} + 10^{c/10} + 10^{d/10}$ )]

x = Duty Cycle

#### Specification

FCC, Part 15 §15.407 (a)(1), (a)(2)
5150 – 5250 MHz
(a)(1) The peak power spectral density shall not exceed +4 dBm in any 1 megahertz band.
5250 – 5350 MHz & 5470 – 5725 MHz
(a)(2) The peak power spectral density shall not exceed +11 dBm in any 1 megahertz band.
Industry Canada RSS-210 § A9.2(1), A9.2(2)
5150 – 5250 MHz
§ A9.2(1) The eirp spectral density shall not exceed +10 dBm in any 1 MHz band
5250 – 5350 MHz & 5470 – 5725 MHz
§ A9.2(2) The power spectral density shall not exceed +11 dBm in any 1 MHz band

#### Traceability

**Test Equipment Used** 

0158, 0287, 0252, 0313, 0314, 0070, 0116, 0117

#### **Test Procedure for Peak Excursion Ratio**

<u>Compliance with the peak excursion requirement is demonstrated by confirming the ratio of the maximum of the peak-hold spectrum</u> <u>to the maximum of the average spectrum</u> during continuous transmission. Section F) of KDB 789033 was used in order to prove compliance. This is a conducted measurement using a spectrum analyzer using dual traces. Peak Excursion Ratio is the difference in amplitude (dB) between both traces; The following identifies two spectrum traces on the same plot. <u>Trace 1</u> is the max hold Peak detector, and <u>Trace 2</u> is the recalled trace data from Peak Power Spectral Density measurements. Each frequency and operational mode is recalled in order to prove compliance.

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:104 of 492

#### **Specification**

#### Limits

**§15.407 (a)(6)** The ratio of the peak excursion of the modulation envelope (measured using a peak hold function) to the peak transmit power (measured as specified in this paragraph) shall not exceed 13dB across any 1MHz bandwidth or the emission bandwidth whichever is less

#### Traceability

**Test Equipment Used** 

0158, 0287, 0252, 0313, 0314, 0070, 0116, 0117

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

#### 6.1.1.5. Frequency Stability

FCC, Part 15 Subpart C §15.407(g) Industry Canada RSS-210 §2.1

#### **Test Procedure**

The manufacturer of the equipment is responsible for ensuring that the frequency stability is such that emissions are always maintained within the band of operation under all conditions.

#### Manufacturer Declaration

variation across temperature, and crystal ageing.

The frequency stability of the reference oscillator sets the frequency stability of the RF transceiver signals. Therefore all of the RF signals should have ±10ppm stability. This stability accounts for room temp tolerance of the crystal oscillator circuit, frequency

 $\pm$ 10ppm at 5.250 GHz translates to a maximum frequency shift of  $\pm$ 5.25 KHz. As the edge of the channels is at least one MHz from either of the band edges,  $\pm$ 5.25 KHz is more than sufficient to guarantee that the intentional emission will remain in the band over the entire operating range of the EUT.

#### Specification

#### Limits

**§15.407 (g)** Manufacturers of U-NII devices are responsible for ensuring frequency stability such that an emission is maintained within the band of operation under all conditions of normal operation as specified in the user's manual.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

#### 6.1.2. Radiated Emission Testing

#### FCC, Part 15 Subpart C §15.407(b)(2), §15.205(a)/15.209(a) Industry Canada RSS-210 §A9.3(2); §2.2; §2.6; RSS-Gen §4.7

#### Test Procedure

Testing was performed in a 3-meter anechoic chamber. Preliminary radiated emissions were measured on every azimuth and with the receiving antenna in both horizontal and vertical polarizations. Preliminary emissions were recorded with in Spectrum Analyzer mode, using a maximum peak detector while in peak hold mode. Depending on the frequency band spanned a notch filter and/or waveguide filter was used to remove the fundamental frequency.

Emissions nearest the limits were chosen for maximization and formal measurement using a CISPR compliant receiver. Emissions above 1000 MHz are measured utilizing a CISPR compliant average detector with a tuned receiver, using a bandwidth of 1 MHz. Emissions from 30 MHz – 1000 MHz are measured utilizing a CISPR compliant quasi-peak detector with a tuned receiver, using a bandwidth of 120 kHz. Only the highest emissions relative to the limit are listed.

#### **Field Strength Calculation**

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. All factors are included in the reported data.

#### FS = R + AF + CORR - FO

FS = Field Strength R = Measured Spectrum analyzer Input Amplitude AF = Antenna Factor

#### CORR = Correction Factor = CL – AG + NFL

CL = Cable Loss AG = Amplifier Gain FO = Distance Falloff Factor NFL = Notch Filter Loss or Waveguide Loss

Field Strength Calculation Example:

Given receiver input reading of 51.5 dB $_{\mu}$ V; Antenna Factor of 8.5 dB; Cable Loss of 1.3 dB; Falloff Factor of 0 dB, an Amplifier Gain of 26 dB and Notch Filter Loss of 1 dB. The Field Strength of the measured emission is:

 $FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3 dB\mu V/m$ 

Conversion between dBµV/m (or dBµV) and µV/m (or µV) are done as:

Level (dB $\mu$ V/m) = 20 \* Log (level ( $\mu$ V/m))

40 dBμV/m = 100 μV/m 48 dBμV/m = 250 μV/m

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:107 of 492

The following formula is used to convert the equipment isotropic radiated power (eirp) to field strength ( $dB\mu V/m$ );

$$E = \frac{1000000 \times \sqrt{30P}}{3} \mu V/m}$$
  
where P is the EIRP in Watts  
Therefore: -27 dBm/MHz = 68.23 dBuV/m

**Note:** The data in this Section identifies that the EUT is in compliance with the -27dBm/MHz EIRP limit (68.23 dB $\mu$ V/m) for out of band emissions. All out of band emissions are less than 68.23 dB  $\mu$ V/m.

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:108 of 492

#### Specification

#### **Radiated Spurious Emissions**

**15.407 (b)(2).** All emissions outside of the 5,150-5,350MHz band shall not exceed an EIRP of - 27dBm/MHz.

**FCC §15.205 (a)** Except as shown in paragraph (d) of 15.205 (a), only spurious emissions are permitted in any of the frequency bands listed.

**FCC §15.205 (a)** Except as shown in paragraphs (d) and (e) of this section, the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section §15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasipeak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in Section 15.35 apply to these measurements.

**FCC §15.209 (a)** Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table.

**RSS-210 §A9.3(2)** For transmitters operating in the 5250-5350 MHz band, all emissions outside the 5150-5350 MHz band shall not exceed -27 dBm/MHz e.i.r.p. Devices operating in the 5250-5350 MHz band that generate emissions in the 5150-5250 MHz band shall not exceed out of band emission limit of 27 dBm/MHz e.i.r.p. in the 5150-5250 MHz band in order to operate indoor/outdoor, or alternatively shall comply with the spectral power density for operation within the 5150-5250 MHz band and shall be labeled "for indoor use only".

**RSS-Gen §4.7** The search for unwanted emissions shall be from the lowest frequency internally generated or used in the device (local oscillator, intermediate of carrier frequency), or from 30 MHz, whichever is the lowest frequency, to the 5<sup>th</sup> harmonic of the highest frequency generated without exceeding 40 GHz.

#### RSS-Gen §6 Receiver Spurious Emission Standard

If a radiated measurement is made, all spurious emissions shall comply with the limits of the following Table. The resolution bandwidth of the spectrum analyzer shall be 100 kHz for spurious emission measurements below 1.0 GHz and 1.0 MHz for measurements above 1.0 GHz

## 6.1.2.3. Digital Emissions (30M-1 GHz)

#### FCC, Part 15 Subpart C §15.205/ §15.209 Industry Canada RSS-210 §2.2

#### Test Procedure

Testing 30M-1 GHz was performed in a 3-meter anechoic chamber using a CISPR compliant receiver. Preliminary radiated emissions were measured on every azimuth and with the receiving antenna in both horizontal and vertical polarizations. To further maximize emissions the receive antenna was varied between 1 and 4 meters. The emissions are recorded with receiver in peak hold mode. Emissions closest to the limits are measured in the quasi-peak mode with the tuned receiver using a bandwidth of 120 kHz. Only the highest emissions relative to the limit are listed. The anechoic chamber test set-up is identified in Section 6 Test Set-Up Photographs.

The EUT had two methods of powering on ac/dc converter and Power over Ethernet (POE). Both modes were tested for emissions below 1GHz.

#### **Field Strength Calculation**

The field strength is calculated by adding the Antenna Factor and Cable Loss, and subtracting Amplifier Gain from the measured reading. In this test facility, the Antenna Factor, Cable Loss, and Amplifier Gains are loaded into the Rohde & Schwarz Receiver and the corrected field strength can be read directly on the receiver.

where:

FS = R + AF + CORR

FS = Field Strength R = Measured Receiver Input Amplitude AF = Antenna Factor CORR = Correction Factor = CL – AG + NFL CL = Cable Loss AG = Amplifier Gain

For example:

Given a Receiver input reading of 51.5dB $\mu$ V; Antenna Factor of 8.5dB; Cable Loss of 1.3dB; Falloff Factor of 0dB, an Amplifier Gain of 26dB and Notch Filter Loss of 1dB. The Field Strength of the measured emission is:

 $FS = 51.5 + 8.5 + 1.3 - 26.0 + 1 = 36.3 dB\mu V/m$ 

Conversion between dB $\mu$ V/m (or dB $\mu$ V) and  $\mu$ V/m (or  $\mu$ V) are done as:

Level (dB $\mu$ V/m) = 20 \* Log (level ( $\mu$ V/m))

40 dBμV/m = 100μV/m 48 dBμV/m = 250μV/m

## Specification

#### Limits

**§15.205 (a)** Except as shown in paragraph (d) of 15.205 (a), only spurious emissions are permitted in any of the frequency bands listed.

**§15.205 (a)** Except as shown in paragraphs (d) and (e) of this section, the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section §15.209. At frequencies equal to or less than 1000 MHz, compliance with the limits in Section 15.209 shall be demonstrated using measurement instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in Section 15.35 apply to these measurements.

**§15.209 (a)** Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table.

| Frequency(MHz) | Field Strength<br>(μV/m) | Field Strength<br>(dBμV/m) | Measurement Distance<br>(meters) |
|----------------|--------------------------|----------------------------|----------------------------------|
| 30-88          | 100                      | 40.0                       | 3                                |
| 88-216         | 150                      | 43.5                       | 3                                |
| 216-960        | 200                      | 46.0                       | 3                                |
| Above 960      | 500                      | 54.0                       | 3                                |

## 6.1.3. AC Wireline Conducted Emissions (150 kHz – 30 MHz)

FCC, Part 15 Subpart C §15.207 Industry Canada RSS-Gen §7.2.2

#### Test Procedure

The EUT is configured in accordance with ANSI C63.4. The conducted emissions are measured in a shielded room with a spectrum analyzer in peak hold in the first instance. Emissions closest to the limit are measured in the quasi-peak mode (QP) with the tuned receiver using a bandwidth of 9 kHz. The emissions are maximized further by cable manipulation. The highest emissions relative to the limit are listed.

#### Measurement Results for AC Wireline Conducted Emissions (150 kHz – 30 MHz)

Ambient conditions. Temperature: 17 to 23 °C Relative humidity: 31 to 57 % Pressure: 999 to 1012 mbar

As a result of the XI-AC1300 being supplied with dc power no ac Wireline measurements were necessary

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:131 of 492

#### Specification

#### Limit

**§15.207 (a)** Except as shown in paragraphs (b) and (c) of this section, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits in the following table, as measured using a 50  $\mu\Omega$  line impedance stabilization network (LISN), see §15.207 (a) matrix below. Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal.

## **RSS-Gen §7.2.2**

The radio frequency voltage that is conducted back into the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in the table below. The tighter limit applies at the frequency range boundaries.

#### §15.207 (a) and RSS-Gen §7.2.2 Limit Matrix

The lower limit applies at the boundary between frequency ranges

| Frequency of Emission (MHz) | Conducted Limit (dBµV) |           |  |  |
|-----------------------------|------------------------|-----------|--|--|
|                             | Quasi-peak             | Average   |  |  |
| 0.15-0.5                    | 66 to 56*              | 56 to 46* |  |  |

#### 6.2. DFS (Dynamic Frequency Selection) FCC, Part 15 Subpart C §15.407(h) FCC 06-96 Memorandum Opinion and Order Industry Canada RSS-210 A9.4

## 6.2.1. <u>Interference Threshold values, Master or Client incorporating In-Service</u> <u>Monitoring</u>

| Maximum Transmit Power  | Value      |  |  |
|---|------------|--|--|
|   | (see note) |  |  |
| ≥ 200 milliwatt   | -64 dBm    |  |  |
| < 200 milliwatt   | -62 dBm    |  |  |
| Note 1: This is the level at the input of the receiver assuming a 0 dBi receive antenna |            |  |  |

DFS Response requirement values

| Parameter                         | Value   |
|-----------------------------------|---|
| Non-occupancy period              | Minimum 30 minutes  |
| Channel Availability Check Time   | 60 seconds  |
| Channel Move Time                 | 10 seconds  |
|                                   | See Note 1.   |
| Channel Closing Transmission Time | 200 milliseconds + an<br>aggregate of 60<br>milliseconds over<br>remaining 10 second<br>period.<br>See Notes 1 and 2. |
| U-NII Detection Bandwidth         | Minimum 80% of the 99%<br>power bandwidth See<br>Note 3.  |

Note 1: The instant that the *Channel Move Time* and the *Channel Closing Transmission Time* begins is as follows:

- For the Short pulse radar Test Signals this instant is the end of the *Burst*.
- For the Frequency Hopping radar Test Signal, this instant is the end of the last radar *Burst* generated.
- For the Long Pulse radar Test Signal this instant is the end of the 12 second period defining the radar transmission.
- Note 2: The *Channel Closing Transmission Time* is comprised of 200 milliseconds starting at the beginning of the *Channel Move Time* plus any additional intermittent control signals required to facilitate *Channel* changes (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.

Note 3: During the *U-NII Detection Bandwidth* detection test, radar type 1 is used and for each frequency step the minimum percentage of detection is 90%. Measurements are performed with no data traffic.

## 6.2.2. Radar Test Waveforms

This section provides the parameters for required test waveforms, minimum percentage of successful detections, and the minimum number of trials that must be used for determining DFS conformance. Step intervals of 0.1 microsecond for Pulse Width, 1 microsecond for PRI, 1 MHz for chirp width and 1 for the number of pulses will be utilized for the random determination of specific test waveforms.

## Short Pulse Radar Test Waveforms

| Radar                       | Pulse Width | PRI     | Number | Minimum       | Minimum |
|-----------------------------|-------------|---------|--------|---------------|---------|
| Туре                        | (µsec)      | (µsec)  | of     | Percentage of | Trials  |
| -                           |             |         | Pulses | Successful    |         |
|                             |             |         |        | Detection     |         |
| 1                           | 1           | 1428    | 18     | 60%           | 30      |
| 2                           | 1-5         | 150-230 | 23-29  | 60%           | 30      |
| 3                           | 6-10        | 200-500 | 16-18  | 60%           | 30      |
| 4                           | 11-20       | 200-500 | 12-16  | 60%           | 30      |
| Aggregate (Radar Types 1-4) |             |         |        | 80%           | 120     |

A minimum of 30 unique waveforms are required for each of the short pulse radar types 2 through 4. For short pulse radar type 1, the same waveform is used a minimum of 30 times. If more than 30 waveforms are used for short pulse radar types 2 through 4, then each additional waveform must also be unique and not repeated from the previous waveforms. The aggregate is the average of the percentage of successful detections of short pulse radar types 1-4.

#### Long Pulse Radar Test Waveform

| Radar | Pulse  | Chirp | PRI    | Number           | Number           | Minimum       | Minimum |
|-------|--------|-------|--------|------------------|------------------|---------------|---------|
| Туре  | Width  | Width | (µsec) | of Pulses        | of <i>Bursts</i> | Percentage    | Trials  |
|       | (µsec) | (MHz) |        | per <i>Burst</i> |                  | of Successful |         |
|       |        |       |        |                  |                  | Detection     |         |
| 5     | 50-100 | 5-20  | 1000-  | 1-3              | 8-20             | 80%           | 30      |
|       |        |       | 2000   |                  |                  |               |         |

The parameters for this waveform are randomly chosen. Thirty unique waveforms are required for the Long Pulse radar test signal. If more than 30 waveforms are used for the Long Pulse radar test signal, then each additional waveform must also be unique and not repeated from the previous waveforms.

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:134 of 492

Each waveform is defined as follows:

- 1) The transmission period for the Long Pulse Radar test signal is 12 seconds.
- 2) There are a total of 8 to 20 *Bursts* in the 12 second period, with the number of *Bursts* being randomly chosen. This number is *Burst Count*.
- 3) Each *Burst* consists of 1 to 3 pulses, with the number of pulses being randomly chosen. Each *Burst* within the 12 second sequence may have a different number of pulses.
- 4) The pulse width is between 50 and 100 microseconds, with the pulse width being randomly chosen. Each pulse within a *Burst* will have the same pulse width. Pulses in different *Bursts* may have different pulse widths.
- 5) Each pulse has a linear FM chirp between 5 and 20 MHz, with the chirp width being randomly chosen. Each pulse within a *Burst* will have the same chirp width. Pulses in different *Bursts* may have different chirp widths. The chirp is centered on the pulse. For example, with a radar frequency of 5300 MHz and a 20 MHz chirped signal, the chirp starts at 5290 MHz and ends at 5310 MHz.
- 6) If more than one pulse is present in a *Burst*, the time between the pulses will be between 1000 and 2000 microseconds, with the time being randomly chosen. If three pulses are present in a *Burst*, the time between the first and second pulses is chosen independently of the time between the second and third pulses.
- 7) The 12 second transmission period is divided into even intervals. The number of intervals is equal to *Burst\_Count*. Each interval is of length (12,000,000 / *Burst\_Count*) microseconds. Each interval contains one *Burst*. The start time for the *Burst*, relative to the beginning of the interval, is between 1 and [(12,000,000 / *Burst\_Count*) (Total *Burst* Length) + (One Random PRI Interval)] microseconds, with the start time being randomly chosen. The step interval for the start time is 1 microsecond. The start time for each *Burst* is chosen independently.

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:135 of 492

## A representative example of a Long Pulse radar test waveform:

- 1) The total test signal length is 12 seconds.
- 2) 8 Bursts are randomly generated for the Burst\_Count.
- 3) Burst 1 has 2 randomly generated pulses.
- 4) The pulse width (for both pulses) is randomly selected to be 75 microseconds.
- 5) The PRI is randomly selected to be at 1213 microseconds.
- 6) Bursts 2 through 8 are generated using steps 3 5.
- 7) Each Burst is contained in even intervals of 1,500,000 microseconds. The starting location for Pulse 1, Burst 1 is randomly generated (1 to 1,500,000 minus the total Burst 1 length + 1 random PRI interval) at the 325,001 microsecond step. Bursts 2 through 8 randomly fall in successive 1,500,000 microsecond intervals (i.e. Burst 2 falls in the 1,500,001 3,000,000 microsecond range).

#### Graphical representation of the Long Pulse radar Test Waveform.

| Туре                                  | Width  | (µsec) | per    | Rate    | Sequence | Percentage of | Trials  |
|                                       | (µsec) |        | Нор    | (kHz)   | Length   | Successful    |         |
|                                       |        |        |        |         | (msec)   | Detection     |         |
| 6                                     | 1      | 333    | 9      | .333    | 300      | 70%           | 30      |

For the Frequency Hopping Radar Type, the same *Burst* parameters are used for each waveform. The hopping sequence is different for each waveform and a 100-length segment is selected from the hopping sequence defined by the following algorithm:

## 6.2.4. Radar Waveform Calibration

The following equipment setup was used to calibrate the conducted Radar Waveform. A spectrum analyzer was used to establish the test signal level for each radar type. During this process there were no transmissions by either the Master or Client Device. The spectrum analyzer was switched to the zero span (Time Domain) mode at the frequency of the Radar Waveform generator. Peak detection was utilized. The spectrum analyzer resolution bandwidth (RBW) and video bandwidth (VBW) were set to 3 MHz.

The signal generator amplitude was set so that the power level measured at the spectrum analyzer was -61dBm (Ref Section 5.1). The 30dB amplifier gain was entered as an amplitude offset on the spectrum analyzer.

**Conducted Calibration Setup**

## 6.2.5. DFS Test Configuration and Set-up

Setup for Conducted Measurements where the EUT is the Master with injection of Radar Test Waveforms at the Master.

## Support Equipment Configuration

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

The EUT is a Client Device without radar detection.

## Applicability of DFS Requirements Prior to Use of a Channel

| Requirement                        | Operational Mode |   |                                   |  |  |
|------------------------------------|------------------|---|-----------------------------------|--|--|
|                                    | Master           | Client<br>Without<br>Radar<br>Detection | Client With<br>Radar<br>Detection |  |  |
| Non-Occupancy Period               | Yes              | Not required                            | Yes                               |  |  |
| DFS Detection Threshold            | Yes              | Not required                            | Yes                               |  |  |
| Channel Availability Check<br>Time | Yes              | Not required                            | Not required                      |  |  |
| Uniform Spreading                  | Yes              | Not required                            | Not required                      |  |  |

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

For the frequency band 5,470 – 5,725 MHz, the Master device provides, on aggregate, uniform loading of the spectrum across all devices by selecting an operating channel among the available channels using a random algorithm.

Declared minimum antenna gain 5 dBi. ;

Radar receive signal level = -64 dBm + minimum antenna gain + 1 dB

= -64 + 5

Radar receive signal level = -58 dBm

#### Measurement Results - Dynamic Frequency Selection (DFS)

Ambient conditions. Temperature: 17 to 23 °C Relative humidity: 31 to 57% Pressure: 999 to 1012 mbar

Radio parameters. Test methodology: Conducted Device Type: Master Transmit Power: Maximum

## **Operational Details - Dynamic Frequency Selection (DFS)**

Operational Modes: 802.11a, 802.11n HT40, and 802.11ac 80

Data Rates: 18 Mbit/s 802.11a/ 3 MCS 802.11n/ac

\*Note\* video pixilation was observed during the video stream at these rates, however they were very minor and only occurred a few times but the video maintained 30 frames per second.

## Video Streaming Method - Dynamic Frequency Selection (DFS)

Using the VideoLan player a video stream was setup on the master laptop with the destination being the client laptop. The video profile chosen for the video stream is "MPEG-2 + MPGA (TS)". On the client laptop the VideoLan player was setup to listen to an incoming video stream from the master device.

The requisite MPEG video file ("TestFile.mpg" available on the NTIA website at the following link http://ntiacsd.ntia.doc.gov/dfs/) is used during this video stream.

### 6.2.6.2. UNII Detection Bandwidth:

All UNII channels for this device have identical channel bandwidths and DFS testing was completed on channel 5,500 MHz (802.11a), 5510MHz (HT40), and 5530 (AC80).

The generating equipment is configured as shown in the Conducted Test Setup above. A single Burst of the short pulse radar Type 1 through 6 was produced at 5,500 MHz (802.11a), 5,510 MHz (802.11n HT40), and 5,530 MHz (802.11ac 80 at a level of -64 dBm (Ref Section 5.1). The EUT is set up as a standalone device (no associated Client and no traffic).

A single radar Burst is generated for a minimum of 10 trials, and the response of the EUT is noted. The EUT must detect the Radar Waveform 90% or more of the time.

The radar frequency is increased in 1 MHz steps, repeating the above test sequence, until the detection rate falls below 90%. The highest frequency at which detection is greater than or equal to 90% is denoted as  $F_{H}$ .

The radar frequency is decreased in 1 MHz steps, repeating the above test sequence, until the detection rate falls below 90%. The lowest frequency at which detection is greater than or equal to 90% is denoted as  $F_L$ .

The U-NII Detection Bandwidth is calculated as follows: U-NII Detection Bandwidth =  $F_H - F_L$ 

The U-NII Detection Bandwidth must be at least 80% of the EUT transmitter 99% power Table of results are continued on the next page.

### 6.2.6.3. Initial Channel Availability Check Time

This test verifies that the EUT does not emit pulse, control, or data signals on the test Channel until the power-up sequence has been completed and the U-NII device checks for Radar Waveforms for one minute on the test Channel. This test does not use any Radar Waveforms.

The U-NII device is powered on and be instructed to operate at 5,500MHz 802.11a and 5,510MHz 802.11n HT40. At the same time the EUT is powered on, the spectrum analyzer is set for zero span with a 1 MHz resolution bandwidth at 5,500, 5,510, and 5530 MHz with a 260 second sweep time. The analyzer's sweep will be started the same time power is applied to the U-NII device.

The EUT should not transmit any pulse or data transmissions until at least 1 minute after the completion of the power-on cycle.

The first red marker line shown on the following plot denotes the instant when the EUT starts its power-up sequence i.e.  $T_0$  (as defined within the FCC's MO&O 06-96 Normative Reference 2). The power-up reference  $T_0$  is determined by the time it takes for the EUT to start "beaconing" i.e. initial beacon – 60 secs = end of power-up.

The Channel Availability Check Time commences at instant  $T_0$  and will end no sooner than  $T_0$  + 60 seconds.

### 6.2.6.4. Radar Burst at the Beginning of the Channel Availability Check Time:

The steps below define the procedure to verify successful radar detection on the selected Channel during a period equal to the Channel Availability Check Time and avoidance of operation on that Channel when a radar Burst with a level equal to the DFS Detection Threshold +6 dB (-64 dBm Ref Section 6.1.7) occurs at the beginning of the Channel Availability Check Time.

A single Burst of short pulse of radar Type 1 will commence within a 6 second window starting at  $T_0$  (first red marker line on the following plot).

Visual indication on the EUT of successful detection of the radar Burst will be recorded and reported. Observation of emissions at 5,500MHz 802.11a & 5,510MHz, 802.11n HT40, 5530MHz 802.11ac 80, and will continue for 2.5 minutes after the radar burst has been generated.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### 6.2.6.5. Radar Burst at the End of the Channel Availability Check Time:

The steps below define the procedure to verify successful radar detection on the selected Channel during a period equal to the Channel Availability Check Time and avoidance of operation on that Channel when a radar Burst with a level equal to the DFS Detection Threshold occurs at the end of the Channel Availability Check Time.

A single Burst of short pulse of radar type 1 will commence within a 6 second window starting at  $T_0$ + 54 seconds. The window will commence at marker 2 and end at the red frequency line  $T_2$ .

Visual indication on the EUT of successful detection of the radar Burst will be recorded and reported. Observation of emissions at 5,500MHz 802.11a, 5,510MHz 802.11n HT40, 5530MHz 802.11ac 80 will continue for 2.5 minutes after the radar burst has been generated.

#### 6.2.6.6. In-Service Monitoring for Channel Move Time, Channel Closing Transmission Time and Non-Occupancy Period

### FCC §15.407(h)(2)(iii)

The steps below define the procedure to determine the above mentioned parameters when a radar Burst with a level equal to the DFS Detection Threshold is generated on the Operating Channel of the U-NII device.

A U-NII device operating as a Client Device will associate with the EUT (Master). The requisite MPEG video file ("TestFile.mpg" available on the NTIA website at the following link http://ntiacsd.ntia.doc.gov/dfs/) is streamed from the master device (AP) to the client.

#### **Channel Closing Transmission Time and Channel Mode Time - Measurement**

The test system was set-up to capture all transmission data for access point events above a threshold level of -50 dBm. The test equipment time stamps all captured events.

A Type 1 waveform was introduced to the EUT, from which a 12 second transmission record was digitally captured. The start of the Type 1 radar waveform is indicated in the test result plot as "Start Waveform", the end of the waveform is indicated as "End waveform".

Channel Closing Transmission Time, and the Channel Move Time start immediately after the last radar pulse is transmitted.

The aggregate of all pulses seen after the end of the radar injection are measured as the "Channel Closing Transmission time".

The last EUT activity after the end of the radar pulse is identified and used to determine the "Channel Mode Time"

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

Title:Xirrus Inc. XI-AC1300, XI-AC867 (DFS Bands)To:FCC 47 CFR Part 15.407 & IC RSS-210Serial #:XIRR04-U8 Rev AIssue Date:22nd September 2014Page:164 of 492

Channel Closing Transmission Time 5,500 MHz (802.11a) = <u>0.00 Secs (limit 260 mSecs)</u>

Channel Move Time 5,500MHz (802.11a) = 0.204 Secs (limit 10 Secs)

### Channel Move Time, Channel Closing Transmission Time for Type 1 Radar Captured by the Test System - 0 to 12 seconds

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

Channel Closing Transmission Time 5,510 MHz (802.11n HT40) = <u>0.044 mSecs</u> (limit 260 mSecs)

Channel Move Time 5,510 MHz (802.11n HT40) = 0.201 mSecs (limit 10 Secs)

### Channel Move Time, Channel Closing Transmission Time for Type 1 Radar Captured by the Test System - 0 to 12 seconds

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

Channel Closing Transmission Time 5,530 MHz (802.11ac 80) = <u>0.067 mSecs</u> (limit 260 mSecs)

Channel Move Time 5,530 MHz (802.11ac 80) = 0.040 mSecs (limit 10 Secs)

### Channel Move Time, Channel Closing Transmission Time for Type 1 Radar Captured by the Test System - 0 to 12 seconds

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### 30 Minute Non-Occupancy Period

The EUT is monitored for more than 30 minutes following the channel close/move time to verify no transmissions resume on this Channel.

30 Minute Non-Occupancy Period Type 1 Radar 5,500MHz 802.11a

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### 6.2.6.7. Statistical Performance Check

The steps below define the procedure to determine the minimum percentage of detection when a radar burst with a level equal to the DFS Detection Threshold is generated on the Operating Channel of the U-NII device.

A U-NII device operating as a Client Device will associate with the UUT (Master) at 5,500MHz 802.11a, 5,510MHz 802.11n HT40, and 802.11ac 80.

The Radar Waveform generator sends the individual waveform for each of the radar types 1-6. Statistical data will be gathered to determine the ability of the device to detect the radar test waveforms. The device can utilize a test mode to demonstrate when detection occurs to prevent the need to reset the device between trial runs. The percentage of successful detection is calculated by:

Total # of detections ÷ Total # of Trials × 100 = Probability of Detection

The Minimum number of trails, minimum percentage of successful detection and the average minimum percentage of successful detection are found in the Radar Test Waveforms section.

#### 6.2.7.2. UNII Detection Bandwidth:

All UNII channels for this device have identical channel bandwidths and DFS testing was completed on channel 5,500 MHz (802.11a), 5510MHz (HT40), and 5530 (AC80).

The generating equipment is configured as shown in the Conducted Test Setup above. A single Burst of the short pulse radar Type 1 through 6 was produced at 5,500 MHz (802.11a), 5,510 MHz (802.11n HT40), and 5,530 MHz (802.11ac 80 at a level of -64 dBm (Ref Section 5.1). The EUT is set up as a standalone device (no associated Client and no traffic).

A single radar Burst is generated for a minimum of 10 trials, and the response of the EUT is noted. The EUT must detect the Radar Waveform 90% or more of the time.

The radar frequency is increased in 1 MHz steps, repeating the above test sequence, until the detection rate falls below 90%. The highest frequency at which detection is greater than or equal to 90% is denoted as  $F_{H}$ .

The radar frequency is decreased in 1 MHz steps, repeating the above test sequence, until the detection rate falls below 90%. The lowest frequency at which detection is greater than or equal to 90% is denoted as  $F_L$ .

The U-NII Detection Bandwidth is calculated as follows: U-NII Detection Bandwidth =  $F_H - F_L$ 

The U-NII Detection Bandwidth must be at least 80% of the EUT transmitter 99% power Table of results are continued on the next page.

### 6.2.7.3. Initial Channel Availability Check Time

This test verifies that the EUT does not emit pulse, control, or data signals on the test Channel until the power-up sequence has been completed and the U-NII device checks for Radar Waveforms for one minute on the test Channel. This test does not use any Radar Waveforms.

The U-NII device is powered on and be instructed to operate at 5,500MHz 802.11a and 5,510MHz 802.11n HT40. At the same time the EUT is powered on, the spectrum analyzer is set for zero span with a 1 MHz resolution bandwidth at 5,500, 5,510, and 5530 MHz with a 260 second sweep time. The analyzer's sweep will be started the same time power is applied to the U-NII device.

The EUT should not transmit any pulse or data transmissions until at least 1 minute after the completion of the power-on cycle.

The first red marker line shown on the following plot denotes the instant when the EUT starts its power-up sequence i.e.  $T_0$  (as defined within the FCC's MO&O 06-96 Normative Reference 2). The power-up reference  $T_0$  is determined by the time it takes for the EUT to start "beaconing" i.e. initial beacon – 60 secs = end of power-up.

The Channel Availability Check Time commences at instant  $T_0$  and will end no sooner than  $T_0$  + 60 seconds.

### 6.2.7.4. Radar Burst at the Beginning of the Channel Availability Check Time:

The steps below define the procedure to verify successful radar detection on the selected Channel during a period equal to the Channel Availability Check Time and avoidance of operation on that Channel when a radar Burst with a level equal to the DFS Detection Threshold +6 dB (-64 dBm Ref Section 6.1.7) occurs at the beginning of the Channel Availability Check Time.

A single Burst of short pulse of radar Type 1 will commence within a 6 second window starting at  $T_0$  (first red marker line on the following plot).

Visual indication on the EUT of successful detection of the radar Burst will be recorded and reported. Observation of emissions at 5,500MHz 802.11a & 5,510MHz, 802.11n HT40, 5530MHz 802.11ac 80, and will continue for 2.5 minutes after the radar burst has been generated.

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### 6.2.7.5. Radar Burst at the End of the Channel Availability Check Time:

The steps below define the procedure to verify successful radar detection on the selected Channel during a period equal to the Channel Availability Check Time and avoidance of operation on that Channel when a radar Burst with a level equal to the DFS Detection Threshold occurs at the end of the Channel Availability Check Time.

A single Burst of short pulse of radar type 1 will commence within a 6 second window starting at  $T_0$ + 54 seconds. The window will commence at marker 2 and end at the red frequency line  $T_2$ .

Visual indication on the EUT of successful detection of the radar Burst will be recorded and reported. Observation of emissions at 5,500MHz 802.11a, 5,510MHz 802.11n HT40, 5530MHz 802.11ac 80 will continue for 2.5 minutes after the radar burst has been generated.

#### 6.2.7.6. In-Service Monitoring for Channel Move Time, Channel Closing Transmission Time and Non-Occupancy Period

### FCC §15.407(h)(2)(iii)

The steps below define the procedure to determine the above mentioned parameters when a radar Burst with a level equal to the DFS Detection Threshold is generated on the Operating Channel of the U-NII device.

A U-NII device operating as a Client Device will associate with the EUT (Master). The requisite MPEG video file ("TestFile.mpg" available on the NTIA website at the following link http://ntiacsd.ntia.doc.gov/dfs/) is streamed from the master device (AP) to the client.

#### **Channel Closing Transmission Time and Channel Mode Time - Measurement**

The test system was set-up to capture all transmission data for access point events above a threshold level of -50 dBm. The test equipment time stamps all captured events.

A Type 1 waveform was introduced to the EUT, from which a 12 second transmission record was digitally captured. The start of the Type 1 radar waveform is indicated in the test result plot as "Start Waveform", the end of the waveform is indicated as "End waveform".

Channel Closing Transmission Time, and the Channel Move Time start immediately after the last radar pulse is transmitted.

The aggregate of all pulses seen after the end of the radar injection are measured as the "Channel Closing Transmission time".

The last EUT activity after the end of the radar pulse is identified and used to determine the "Channel Mode Time"

This test report may be reproduced in full only. The document may only be updated by MiCOM Labs personnel. Any changes will be noted in the Document History section of the report.

### 6.2.7.7. Statistical Performance Check

The steps below define the procedure to determine the minimum percentage of detection when a radar burst with a level equal to the DFS Detection Threshold is generated on the Operating Channel of the U-NII device.

A U-NII device operating as a Client Device will associate with the UUT (Master) at 5,500MHz 802.11a, 5,510MHz 802.11n HT40, and 802.11ac 80.

The Radar Waveform generator sends the individual waveform for each of the radar types 1-6. Statistical data will be gathered to determine the ability of the device to detect the radar test waveforms. The device can utilize a test mode to demonstrate when detection occurs to prevent the need to reset the device between trial runs. The percentage of successful detection is calculated by:

Total # of detections ÷ Total # of Trials × 100 = Probability of Detection

The Minimum number of trails, minimum percentage of successful detection and the average minimum percentage of successful detection are found in the Radar Test Waveforms section.
