SCOPE

An electromagnetic emissions test has been performed on the Xirrus, Inc. models XN16 and XN8 pursuant to the following rules:

Industry Canada RSS-Gen Issue 2
RSS 210 Issue 7 "Low-power Licence-exempt Radiocommunication Devices (All Frequency Bands): Category I Equipment"
FCC Part 15 Subpart C

Conducted and radiated emissions data has been collected, reduced, and analyzed within this report in accordance with measurement guidelines set forth in the following reference standards and as outlined in Elliott Laboratories test procedures:

ANSI C63.4:2003
FCC DTS Measurement Procedure KDB558074, March 2005

The intentional radiator above has been tested in a simulated typical installation to demonstrate compliance with the relevant Industry Canada performance and procedural standards.

Final system data was gathered in a mode that tended to maximize emissions by varying orientation of EUT, orientation of power and I/O cabling, antenna search height, and antenna polarization.

Every practical effort was made to perform an impartial test using appropriate test equipment of known calibration. All pertinent factors have been applied to reach the determination of compliance.

The test results recorded herein are based on a single type test of the Xirrus, Inc. models XN16 and XN8 and therefore apply only to the tested sample. The sample was selected and prepared by Steve Smith of Xirrus, Inc.

OBJECTIVE

The primary objective of the manufacturer is compliance with the regulations outlined in the previous section.

Prior to marketing in the USA, all unlicensed transmitters and transceivers require certification. Receive-only devices operating between 30 MHz and 960 MHz are subject to either certification or a manufacturer's declaration of conformity, with all other receive-only devices exempt from the technical requirements.

Prior to marketing in Canada, Class I transmitters, receivers and transceivers require certification. Class II devices are required to meet the appropriate technical requirements but are exempt from certification requirements.

Certification is a procedure where the manufacturer submits test data and technical information to a certification body and receives a certificate or grant of equipment

authorization upon successful completion of the certification body's review of the submitted documents. Once the equipment authorization has been obtained, the label indicating compliance must be attached to all identical units, which are subsequently manufactured.

Maintenance of compliance is the responsibility of the manufacturer. Any modification of the product which may result in increased emissions should be checked to ensure compliance has been maintained (i.e., printed circuit board layout changes, different line filter, different power supply, harnessing or I/O cable changes, etc.).

STATEMENT OF COMPLIANCE

The tested sample of Xirrus, Inc. models XN16 and XN8 complied with the requirements of the following regulations:

- Industry Canada RSS-Gen Issue 2
- RSS 210 Issue 7 "Low-power Licence-exempt Radiocommunication Devices (All Frequency Bands): Category I Equipment"
- FCC Part 15 Subpart C

Maintenance of compliance is the responsibility of the manufacturer. Any modification of the product which may result in increased emissions should be checked to ensure compliance has been maintained (i.e., printed circuit board layout changes, different line filter, different power supply, harnessing or I/O cable changes, etc.).

TEST RESULTS SUMMARY**DIGITAL TRANSMISSION SYSTEMS (2400 – 2483.5MHz)**

FCC Rule Part	RSS Rule Part	Description	Measured Value / Comments	Limit / Requirement	Result
15.247(a)	RSS 210 A8.2	Digital Modulation	Systems uses OFDM / DSSS techniques	-	Complies
15.247 (a) (2)	RSS 210 A8.2 (1)	6dB Bandwidth	9.6 MHz	>500kHz	Complies
	RSP100	99% Bandwidth	b: 15.8 MHz g: 17.1 MHz n20: 18.3 MHz n40: 37.1 MHz	Information only	Complies
15.247 (b) (3)	RSS 210 A8.2 (4)	Output Power (multipoint systems)	b: 19.5/24.3 dBm b3x: 23.7/28.2dBm g:18.4/23.2dBm g3x:22.9/27.7dBm n20:23.0/27.7 dBm n40: 22.6dBm EIRP = 4.0 W ^{Note 1}	1 Watt, EIRP limited to 4 Watts.	Complies
15.247(d)	RSS 210 A8.2 (2)	Power Spectral Density	7.4 dBm / 3kHz	8dBm/3kHz	Complies
15.247(c)	RSS 210 A8.5	Antenna Port Spurious Emissions 30MHz – 25 GHz	All spurious more than 30dB below fundamental	< -30dBc ^{Note 2}	Complies
15.247(c) / 15.209	RSS 210 A8.5	Radiated Spurious Emissions 30MHz – 25 GHz	53.9dBμV/m (495.5μV/m) @ 2483.5MHz	15.207 in restricted bands, all others <-30dBc ^{Note 2}	Complies (-0.1dB)

Note 1: EIRP calculated using antenna gain of 3 dBi (7.77dBi for legacy 3x MIMO mode) for the highest EIRP multi-point system. The highest EIRP is with three radios operational, all using 802.11b 3x3 MIMO mode (3 chains per radio)

Note 2: Limit of -30dBc used because the power was measured using the UNII test procedure (maximum power averaged over a transmission burst) / RMS averaging over a time interval, as permitted under RSS 210 section A8.4(4).

Legacy mode MIMO operation is noted by b3x and g3x.

Where output powers are listed as two values, the first value is the output power on a single radio and the second value for 3 radios operational (this applies only to 20MHz channels).

DIGITAL TRANSMISSION SYSTEMS (5725 –5850 MHz)

FCC Rule Part	RSS Rule Part	Description	Measured Value / Comments	Limit / Requirement	Result
15.247(a)	RSS 210 A8.2	Digital Modulation	Systems uses OFDM / DSSS techniques	System must utilize a digital transmission technology	Complies
15.247 (a) (2)	RSS 210 A8.2 (1)	6dB Bandwidth	>16.3 MHz	>500kHz	Complies
	RSP100	99% Bandwidth	a: 17.4 MHz n20: 18.6 MHz n40: 37.0 MHz z	Information only	Complies
15.247 (b)	RSS 210 A8.2 (4)	Output Power (multipoint systems)	a: 15.1/22.1dBm a 2x: 17.5/24.5 dBm n20: 17.4/24.4 dBm n40: 17.2/20.2 dBm EIRP = 2.26 W ^{Note 1}	1 Watt, EIRP limited to 4 Watts.	Complies
15.247(d)	RSS 210 A8.2 (2)	Power Spectral Density	-1.8 dBm /3kHz	Maximum permitted is 8dBm/3kHz	Complies
15.247(c)	RSS 210 A8.5	Antenna Port Spurious Emissions – 30MHz – 40 GHz	All spurious more than 30dB below fundamental	< -30dBc ^{Note 2}	Complies
15.247(c) / 15.209	RSS 210 A8.5 Table 2, 3	Radiated Spurious Emissions 30MHz – 40 GHz	53.0dBμV/m @ 11576.3MHz	15.207 in restricted bands, all others <-30dBc ^{Note 2}	Complies (-1.0dB)

Note 1: EIRP calculated using antenna gain of 6 dBi (9dBi for legacy 2x MIMO mode) for the highest EIRP multi-point system. The highest EIRP is with 5 radios operational in the band using 802.11a 2x2 MIMO mode.

Note 2: Limit of -30dBc used because the power was measured using the UNII test procedure (maximum power averaged over a transmission burst) / RMS averaging over a time interval, as permitted under RSS 210 section A8.4(4).

Legacy mode MIMO operation is noted by a2x.

Where output powers are listed as two values, the first value is the output power on a single radio and the second value with the maximum number of radios operational in that mode (5 radios in 20Mhz modes or 2 radios in 40MHz modes).

GENERAL REQUIREMENTS APPLICABLE TO ALL BANDS

FCC Rule Part	RSS Rule part	Description	Measured Value / Comments	Limit / Requirement	Result (margin)
15.203	-	RF Connector	Internal antenna or reverse polarity TNC	Integral or unique connector	Complies
15.109	RSS GEN 7.2.3 Table 1	Receiver spurious emissions	44.2dB μ V/m @ 349.999MHz 47.2dB μ V/m @ 2291.7MHz	Table 1 of RSS GEN	Complies (- 1.8 dB)
15.207	RSS GEN Table 2	AC Conducted Emissions	42.8dB μ V @ 4.670MHz	Refer to standard	Complies (- 3.2 dB)
15.247 (b) (5) 15.407 (f)	RSS 102	RF Exposure Requirements	Refer to MPE calculations in Exhibit 11, RSS 102 declaration and User Manual statements.	Refer to OET 65, FCC Part 1 and RSS 102	Complies

	RSP 100 RSS GEN 7.1.5	User Manual	Refer to user manual for statements	Statement required regarding detachable antenna	Complies

MEASUREMENT UNCERTAINTIES

ISO/IEC 17025 requires that an estimate of the measurement uncertainties associated with the emissions test results be included in the report. The measurement uncertainties given below are based on a 95% confidence level and were calculated in accordance with UKAS document LAB 34.

Measurement Type	Frequency Range (MHz)	Calculated Uncertainty (dB)
Conducted Emissions	0.15 to 30	± 2.4
Radiated Emissions	0.015 to 30	± 3.0
Radiated Emissions	30 to 1000	± 3.6
Radiated Emissions	1000 to 40000	± 6.0

EQUIPMENT UNDER TEST (EUT) DETAILS**GENERAL**

The Xirrus, Inc. models XN16 and XN8 are multi-radio 802.11abgn Access Points which are designed to act as a hub for a wireless local area network (WLAN). The electrical rating of the device is 100/240Vac, 50/60Hz, 0.5-3A. They can be powered via an internal AC-DC adapter or via a PoE interface and dedicated PoE adapter (also sold with the device). Transmitter measurements were made with the device powered via PoE. Digital device emissions were measured with the device powered from the AC-DC adapter to cover both methods of powering the device.

The model XN16 contains 16 separate transceivers. The radio interfaces are provided via four identical circuit boards. Each of the boards has one 802.11bgn radio and three 802.11an radios. Each radio connects to an internal antenna with a gain of 3dBi for the bgn radio and 6dBi for the an radio. Three radio boards can connect to an external antenna via a reverse polarity TNC coaxial connector. The external antenna offered for use is a ceiling mount antenna, model CM2-2400/5500, with a nominal gain of 2.5dBi for all bands and is used to support single-chain legacy modes. The internal antennas support single-chain legacy modes and 3x3 MIMO modes for 2.4GHz, 2x2 MIMO for 5GHz.

The XN8 is identical to the XN16 except that the rf board is depopulated to leave only two transceivers, one that can operate as abgn in both 2.4GHz and 5GHz bands and the other that can operate only in the 5GHz bands as an 802.11an radio.

The individual radios operate independently i.e. they are not configured to transmit the same data but are designed to operate independent networks. The system firmware configures the radios such that no two radios can operate on overlapping channels. Additionally output power per radio may be adjusted to ensure the output power in the 5150 – 5250 MHz, 5250 – 5350 MHz and 5470 – 5725 MHz bands remains below the output power and EIRP limits per band when more than one radio is operating in a band. Power reductions for multi-radio operation in the 2.4 GHz is also implemented for 802.11b MIMO mode. For all other 2.4 GHz modes, and for operation in the 5GHz DTS band, power reduction is not required because the output power (30dBm) and EIRP (36dBm) limits are met when one or multiple radios are operating in those bands, given the restrictions for no two radios operating on overlapping channels. As there are only 3 non-overlapping 2.4GHz channels the fourth 802.11bgn radio is used in a receive-only mode to monitor for rogue APs and perform other security functions.

Normally, the EUT's would be ceiling mounted during operation. The EUT's were tested as both tabletop equipment and also tested with the EUT raised to a height of 1.5m above the ground plane. The highest transmitter emissions were found with the device elevated to a height of 1.5m above the ground plane and final measurements were made with the EUT at that height.

The sample was received on May 28, 2008 and tested on May 14, May 19, May 21, May 22, May 23, May 27, June 3 and June 4, 2008. The EUT consisted of the following component(s):

Manufacturer	Model	Description	Serial Number	FCC ID
Xirrus	XN16	802.11abgn access point	Prototype	SK6XN16
Xirrus	XN8	802.11abgn access point	Prototype	SK6XN8
Xirrus	PoE60U-560(G)-SS-R	Power Injector	P7450010A1	N/A

ANTENNA SYSTEM

The antennas are either integral to the device or connect to the EUT via a non-standard, reverse gender TNC connector, thereby meeting the requirements of FCC 15.203.

The antennas are either integral to the device or connect to the EUT via a non-standard, reverse gender TNC connector, thereby meeting the requirements of FCC 15.203.

ENCLOSURE

The enclosures for the XN16 and XN8 are identical. The enclosure is primarily constructed of plastic. It is circular with a diameter of 48 cm and a height of 10cm.

MODIFICATIONS

The EUT did not require modifications during testing in order to comply with emissions specifications.

SUPPORT EQUIPMENT

The following equipment was used as remote support equipment for emissions testing:

Manufacturer	Model	Description	Serial Number	FCC ID
IBM	R51	Laptop	99-V4543	DoC
Netgear	GS108	Switch	GS16152CB0354 47	DoC

EUT INTERFACE PORTS

The I/O cabling configuration during emissions testing was as follows:

Port	Connected To	Cable(s)		
		Description	Shielded or Unshielded	Length(m)
PoE adapter PoE IN	Switch	Cat 5	Unshielded	10.0
PoE adapter PoE Out	XN-x Data& Power IN	Cat 5	Unshielded	1.0
XN-x Data (To GIG 1/2) OUT	Ethernet 1	Cat 5	Unshielded	0.1
AC Power	PoE	3 wire	Unshielded	1.5

Note 1: The console port on the XN-16 was not connected during testing. This port is used for configuration and troubleshooting purposes only and is not intended to be connected during normal operation.

Note 2: The gigabit ethernet# 2, ethernet# 0 ports on the XN16 were not connected during testing. These ports were not exercised for this configuration.

EUT OPERATION

During AC conducted emissions all 16 radios were transmitting at max power on the following channels: 2412 MHz 802.11b, 2472 MHz 802.11g, 2437MHz 802.11n20, 5180 MHz 802.11a, 5320 MHz 802.11n20, 5500 MHz 802.11n40, 5700 MHz 802.11a, 5825 MHz 802.11n20, 5745 MHz 802.11n 20, 5600 MHz n20, 2412 MHz 802.11n20, 2462 MHz 802.11n20, 5510MHz n40, 5690 MHz 802.11n40, 5240 MHz 802.11a, 5260 MHz 802.11a, 5280 MHz 802.11n20.

During radiated emissions tests all 16 radios (8 for the XS-8) were in receive mode with all chains active on the following channels: 2437 MHz, 5200 MHz, 5280 MHz, 5600 MHz, 5785 MHz, 2412 MHz, 2472 MHz, 5180 MHz, 5320 MHz, 5500 MHz, 5700 MHz, 5785 MHz, 2462 MHz, 5240MHz,5260 MHz, 5540 MHz.

Transmit mode emissions were made with a single transceiver operational for band-edge radiated measurements and rf port measurements. The transmit chain(s) were transmitting continuously. Spurious measurements were made with one radio in 802.11a mode, one in 802.11n20 mode and one in 802.11n40 mode transmitting continuously on top and bottom and, where applicable, center channel.

Additionally a scan was made with all radios operational in different bands to verify that no inter-modulation products of significance were produced. The scan was made with a horn antenna close to the device. No signals were observed other than the harmonics of the individual signals measured during the spurious emissions tests.

Radiated emissions measurements made below 1GHz indicated that the emissions were all related to the digital device (i.e. they did not change when the radios were enabled or disabled, or when the operating frequencies of the radios were changed). Radiated emissions below 1GHz are therefore covered by the Part 15 Class B digital device verification test report.

TEST SITE

GENERAL INFORMATION

Final test measurements were taken on May 14, May 19, May 21, May 22, May 23, May 27, June 3 and June 4, 2008 at the Elliott Laboratories Open Area Test Site #1 & 2 located at 684 West Maude Avenue, Sunnyvale, California. Pursuant to section 2.948 of the FCC's Rules and section 3.3 of RSP-100, construction, calibration, and equipment data has been filed with the Commission.

ANSI C63.4:2003 recommends that ambient noise at the test site be at least 6 dB below the allowable limits. Ambient levels are below this requirement with the exception of predictable local TV, radio, and mobile communications traffic. The test site contains separate areas for radiated and conducted emissions testing. Considerable engineering effort has been expended to ensure that the facilities conform to all pertinent requirements of ANSI C63.4:2003.

CONDUCTED EMISSIONS CONSIDERATIONS

Conducted emissions testing is performed in conformance with ANSI C63.4:2003. Measurements are made with the EUT connected to the public power network through a nominal, standardized RF impedance, which is provided by a line impedance stabilization network, known as a LISN. A LISN is inserted in series with each current-carrying conductor in the EUT power cord.

RADIATED EMISSIONS CONSIDERATIONS

The FCC has determined that radiation measurements made in a shielded enclosure are not suitable for determining levels of radiated emissions. Radiated measurements are performed in an open field environment or in a semi-anechoic chamber. The test sites are maintained free of conductive objects within the CISPR defined elliptical area incorporated in ANSI C63.4:2003 guidelines and meet the Normalized Site Attenuation (NSA) requirements of ANSI C63.4:2003.

MEASUREMENT INSTRUMENTATION

RECEIVER SYSTEM

An EMI receiver as specified in CISPR 16-1 is used for emissions measurements. The receivers used can measure over the frequency range of 9 kHz up to 2000 MHz. These receivers allow both ease of measurement and high accuracy to be achieved. The receivers have Peak, Average, and CISPR (Quasi-peak) detectors built into their design so no external adapters are necessary. The receiver automatically sets the required bandwidth for the CISPR detector used during measurements. If the repetition frequency of the signal being measured is below 20Hz, peak measurements are made in lieu of Quasi-Peak measurements.

For measurements above the frequency range of the receivers, a spectrum analyzer is utilized because it provides visibility of the entire spectrum along with the precision and versatility required to support engineering analysis. Average measurements above 1000MHz are performed on the spectrum analyzer using the linear-average method with a resolution bandwidth of 1 MHz and a video bandwidth of 10 Hz, unless the signal is pulsed in which case the average (or video) bandwidth of the measuring instrument is reduced to onset of pulse desensitization and then increased.

INSTRUMENT CONTROL COMPUTER

The receivers utilize either a Rohde & Schwarz EZM Spectrum Monitor/Controller or contain an internal Spectrum Monitor/Controller to view and convert the receiver measurements to the field strength at an antenna or voltage developed at the LISN measurement port, which is then compared directly with the appropriate specification limit. This provides faster, more accurate readings by performing the conversions described under Sample Calculations within the Test Procedures section of this report. Results are printed in a graphic and/or tabular format, as appropriate. A personal computer is used to record all measurements made with the receivers.

The Spectrum Monitor provides a visual display of the signal being measured. In addition, the controller or a personal computer run automated data collection programs which control the receivers. This provides added accuracy since all site correction factors, such as cable loss and antenna factors are added automatically.

LINE IMPEDANCE STABILIZATION NETWORK (LISN)

Line conducted measurements utilize a fifty microhenry Line Impedance Stabilization Network as the monitoring point. The LISN used also contains a 250 uH CISPR adapter. This network provides for calibrated radio frequency noise measurements by the design of the internal low pass and high pass filters on the EUT and measurement ports, respectively.

FILTERS/ATTENUATORS

External filters and precision attenuators are often connected between the receiving antenna or LISN and the receiver. This eliminates saturation effects and non-linear operation due to high amplitude transient events.

ANTENNAS

A loop antenna is used below 30 MHz. For the measurement range 30 MHz to 1000 MHz either a combination of a biconical antenna and a log periodic or a bi-log antenna is used. Above 1000 MHz, horn antennas are used. The antenna calibration factors to convert the received voltage to an electric field strength are included with appropriate cable loss and amplifier gain factors to determine an overall site factor, which is then programmed into the test receivers or incorporated into the test software.

ANTENNA MAST AND EQUIPMENT TURNTABLE

The antennas used to measure the radiated electric field strength are mounted on a non-conductive antenna mast equipped with a motor-drive to vary the antenna height. Measurements below 30 MHz are made with the loop antenna at a fixed height of 1m above the ground plane.

ANSI C63.4:2003 specifies that the test height above ground for table mounted devices shall be 80 centimeters. Floor mounted equipment shall be placed on the ground plane if the device is normally used on a conductive floor or separated from the ground plane by insulating material from 3 to 12 mm if the device is normally used on a non-conductive floor. During radiated measurements, the EUT is positioned on a motorized turntable in conformance with this requirement.

INSTRUMENT CALIBRATION

All test equipment is regularly checked to ensure that performance is maintained in accordance with the manufacturer's specifications. All antennas are calibrated at regular intervals with respect to tuned half-wave dipoles. An exhibit of this report contains the list of test equipment used and calibration information.

TEST PROCEDURES

EUT AND CABLE PLACEMENT

The regulations require that interconnecting cables be connected to the available ports of the unit and that the placement of the unit and the attached cables simulate the worst case orientation that can be expected from a typical installation, so far as practicable. To this end, the position of the unit and associated cabling is varied within the guidelines of ANSI C63.4:2003, and the worst-case orientation is used for final measurements.

CONDUCTED EMISSIONS

Conducted emissions are measured at the plug end of the power cord supplied with the EUT. Excess power cord length is wrapped in a bundle between 30 and 40 centimeters in length near the center of the cord. Preliminary measurements are made to determine the highest amplitude emission relative to the specification limit for all the modes of operation. Placement of system components and varying of cable positions are performed in each mode. A final peak mode scan is then performed in the position and mode for which the highest emission was noted on all current carrying conductors of the power cord.

RADIATED EMISSIONS

A preliminary scan of the radiated emissions is performed in which all significant EUT frequencies are identified with the system in a nominal configuration. At least two scans are performed, one scan for each antenna polarization (horizontal and vertical; loop parallel and perpendicular to the EUT). During the preliminary scans, the EUT is rotated through 360°, the antenna height is varied (for measurements above 30 MHz) and cable positions are varied to determine the highest emission relative to the limit. Preliminary scans may be performed in a fully anechoic chamber for the purposes of identifying the frequencies of the highest emissions from the EUT.

A speaker is provided in the receiver to aid in discriminating between EUT and ambient emissions. Other methods used during the preliminary scan for EUT emissions involve scanning with near field magnetic loops, monitoring I/O cables with RF current clamps, and cycling power to the EUT.

Final maximization is a phase in which the highest amplitude emissions identified in the spectral search are viewed while the EUT azimuth angle is varied from 0 to 360 degrees relative to the receiving antenna. The azimuth, which results in the highest emission is then maintained while varying the antenna height from one to four meters (for measurements above 30 MHz, measurements below 30 MHz are made with the loop antenna at a fixed height of 1m). The result is the identification of the highest amplitude for each of the highest peaks. Each recorded level is corrected in the receiver using appropriate factors for cables, connectors, antennas, and preamplifier gain.

When testing above 18 GHz, the receive antenna is located at 1 meter from the EUT and the antenna height is restricted to a maximum of 2.5 meters.

Typical Test Configuration for Radiated Field Strength Measurements

The ground plane extends beyond the ellipse defined in CISPR 16 / CISPR 22 / ANSI C63.4 and is large enough to accommodate test distances (d) of 3m and 10m. Refer to the test data tables for the actual measurement distance.

Test Configuration for Radiated Field Strength Measurements
OATS- Plan and Side Views

The anechoic materials on the walls and ceiling ensure compliance with the normalized site attenuation requirements of CISPR 16 / CISPR 22 / ANSI C63.4 for an alternate test site at the measurement distances used.

Floor-standing equipment is placed on the floor with insulating supports between the unit and the ground plane.

Test Configuration for Radiated Field Strength Measurements
Semi-Anechoic Chamber, Plan and Side Views

BANDWIDTH MEASUREMENTS

The 6dB, 20dB and/or 26dB signal bandwidth is measured in using the bandwidths recommended by ANSI C63.4. When required, the 99% bandwidth is measured using the methods detailed in RSS GEN.

SPECIFICATION LIMITS AND SAMPLE CALCULATIONS

The limits for conducted emissions are given in units of microvolts, and the limits for radiated emissions are given in units of microvolts per meter at a specified test distance. Data is measured in the logarithmic form of decibels relative to one microvolt, or dB microvolts (dBuV). For radiated emissions, the measured data is converted to the field strength at the antenna in dB microvolts per meter (dBuV/m). The results are then converted to the linear forms of uV and uV/m for comparison to published specifications.

For reference, converting the specification limits from linear to decibel form is accomplished by taking the base ten logarithm, then multiplying by 20. These limits in both linear and logarithmic form are as follows:

GENERAL TRANSMITTER RADIATED EMISSIONS SPECIFICATION LIMITS

The table below shows the limits for the spurious emissions from transmitters that fall in restricted bands¹ (with the exception of transmitters operating under FCC Part 15 Subpart D and RSS 210 Annex 9), the limits for all emissions from a low power device operating under the general rules of RSS 310 (tables 3 and 4), RSS 210 (table 2) and FCC Part 15 Subpart C section 15.209.

Frequency Range (MHz)	Limit (uV/m)	Limit (dBuV/m @ 3m)
0.009-0.490	$2400/F_{\text{KHz}} @ 300\text{m}$	$67.6-20*\log_{10}(F_{\text{KHz}}) @ 300\text{m}$
0.490-1.705	$24000/F_{\text{KHz}} @ 30\text{m}$	$87.6-20*\log_{10}(F_{\text{KHz}}) @ 30\text{m}$
1.705 to 30	30 @ 30m	29.5 @ 30m
30 to 88	100 @ 3m	40 @ 3m
88 to 216	150 @ 3m	43.5 @ 3m
216 to 960	200 @ 3m	46.0 @ 3m
Above 960	500 @ 3m	54.0 @ 3m

¹ The restricted bands are detailed in FCC 15.203, RSS 210 Table 1 and RSS 310 Table 2

RECEIVER RADIATED SPURIOUS EMISSIONS SPECIFICATION LIMITS

The table below shows the limits for the spurious emissions from receivers as detailed in FCC Part 15.109, RSS 210 Table 2, RSS GEN Table 1 and RSS 310 Table 3. Note that receivers operating outside of the frequency range 30 MHz – 960 MHz are exempt from the requirements of 15.109.

Frequency Range (MHz)	Limit (uV/m @ 3m)	Limit (dBuV/m @ 3m)
30 to 88	100	40
88 to 216	150	43.5
216 to 960	200	46.0
Above 960	500	54.0

OUTPUT POWER LIMITS – DIGITAL TRANSMISSION SYSTEMS

The table below shows the limits for output power and output power density. Where the signal bandwidth is less than 20 MHz the maximum output power is reduced to the power spectral density limit plus 10 times the log of the bandwidth (in MHz).

Operating Frequency (MHz)	Output Power	Power Spectral Density
902 – 928	1 Watt (30 dBm)	8 dBm/3kHz
2400 – 2483.5	1 Watt (30 dBm)	8 dBm/3kHz
5725 – 5850	1 Watt (30 dBm)	8 dBm/3kHz

The maximum permitted output power is reduced by 1dB for every dB the antenna gain exceeds 6dBi. Fixed point-to-point applications using the 5725 – 5850 MHz band are not subject to this restriction.

TRANSMIT MODE SPURIOUS RADIATED EMISSIONS LIMITS – FHSS and DTS SYSTEMS

The limits for unwanted (spurious) emissions from the transmitter falling in the restricted bands are those specified in the general limits sections of FCC Part 15 and RSS 210. All other unwanted (spurious) emissions shall be at least 20dB below the level of the highest in-band signal level (30dB if the power is measured using the sample detector/power averaging method).

SAMPLE CALCULATIONS - CONDUCTED EMISSIONS

Receiver readings are compared directly to the conducted emissions specification limit (decibel form) as follows:

$$R_r - S = M$$

where:

R_r = Receiver Reading in dBuV

S = Specification Limit in dBuV

M = Margin to Specification in +/- dB

SAMPLE CALCULATIONS - RADIATED EMISSIONS

Receiver readings are compared directly to the specification limit (decibel form). The receiver internally corrects for cable loss, preamplifier gain, and antenna factor. The calculations are in the reverse direction of the actual signal flow, thus cable loss is added and the amplifier gain is subtracted. The Antenna Factor converts the voltage at the antenna coaxial connector to the field strength at the antenna elements.

A distance factor, when used for electric field measurements above 30MHz, is calculated by using the following formula:

$$F_d = 20 * \text{LOG}_{10} (D_m/D_s)$$

where:

F_d = Distance Factor in dB

D_m = Measurement Distance in meters

D_s = Specification Distance in meters

For electric field measurements below 30MHz the extrapolation factor is either determined by making measurements at multiple distances or a theoretical value is calculated using the formula:

$$F_d = 40 * \text{LOG}_{10} (D_m/D_s)$$

Measurement Distance is the distance at which the measurements were taken and Specification Distance is the distance at which the specification limits are based. The antenna factor converts the voltage at the antenna coaxial connector to the field strength at the antenna elements.

The margin of a given emission peak relative to the limit is calculated as follows:

$$R_c = R_r + F_d$$

and

$$M = R_c - L_s$$

where:

$$R_r = \text{Receiver Reading in dBuV/m}$$

$$F_d = \text{Distance Factor in dB}$$

$$R_c = \text{Corrected Reading in dBuV/m}$$

$$L_s = \text{Specification Limit in dBuV/m}$$

$$M = \text{Margin in dB Relative to Spec}$$

SAMPLE CALCULATIONS - FIELD STRENGTH TO EIRP CONVERSION

Where the radiated electric field strength is expressed in terms of the equivalent isotropic radiated power (eirp), or where a field strength measurement of output power is made in lieu of a direct measurement, the following formula is used to convert between eirp and field strength at a distance of 3m from the equipment under test:

$$E = \frac{1000000 \sqrt{30 P}}{3} \quad \text{microvolts per meter}$$

where P is the eirp (Watts)

RSS 210 and FCC 15.247 Power Measurement Summary

2.4GHz Band

There are three non-overlapping 20MHz channels and no 40MHz non-overlapping channels. The power measurements below cover the cases where there is only one radio operational in the 2.4GHz band and where there are the maximum number of radios (3x20MHz channel or 1x40MHz channel) operating in the band. For the 802.11b mode the output power per radio has to be reduced from the maximum single-radio power. For all other modes the single radio power level can be used regardless of the number of radios operational in the band.

802.11b - single chain

Power Setting ²	Frequency (MHz)	Output Power		Antenna Gain (dBi)	EIRP ^{Note 2}	
		(dBm) ¹	mW		dBm	W
18.0	2412	18.3	67.6	3.0	21.3	0.135
20.0	2437	19.5	89.1	3.0	22.5	0.178
18.5	2462	17.4	55.0	3.0	20.4	0.110
3 radios in 802.11b mode:		24.3	267.4	4.0	28.3	0.672

802.11b - triple chain (EIRP assumes coherency between chains, effective antenna gain is x3)

Frequency (MHz)	Software Setting	Output Power (dBm)				Antenna Gain (dBi)	EIRP ^{Note 2}	
		A	B	C	Total		dBm	W
2412 MHz	17.5	17.2	15.8	15.3	20.9	7.77	28.7	0.744
2437 MHz	20.0	19.4	18.3	18.9	23.7	7.77	31.4	1.390
2462 MHz	17.5	16.4	15.7	16.7	21.1	7.77	28.8	0.763

Highest power setting with two channels in use, MIMO Mode:

-	20.0	19.4	18.3	18.9	23.7	7.77	31.4	1.390
Output power with three radios operating in 802.11b MIMO mode:					26.7	7.77	34.4	2.781

Highest power setting with three channels in use, MIMO Mode:

-	19.5	18.9	18.2	18.9	23.5	7.77	31.2	1.324
Output power with three radios operating in 802.11b MIMO mode:					28.2	7.77	36.0	3.973

802.11g - single chain

Power Setting ²	Frequency (MHz)	Output Power		Antenna Gain (dBi)	EIRP ^{Note 2}	
		(dBm) ¹	mW		dBm	W
13.5	2412	12.3	17.0	3.0	15.3	0.034
20.0	2437	18.4	69.2	3.0	21.4	0.138
13.5	2462	11.6	14.5	3.0	14.6	0.029
3 radios in 802.11g mode:		23.2	207.5	4.0	27.2	0.521

802.11g - triple chain (EIRP assumes coherency between chains, effective antenna gain is x3)

Frequency (MHz)	Software Setting	Output Power (dBm)				Antenna Gain (dBi)	EIRP ^{Note 2}	
		A	B	C	Total		dBm	W
2412 MHz	14.5	13.3	12.5	11.4	17.2	7.77	25.0	0.317
2437 MHz	20.0	18.6	17.1	18.5	22.9	7.77	30.7	1.164
2462 MHz	13.5	11.6	11.2	11.9	16.3	7.77	24.1	0.258

Highest power setting with three channels in use, MIMO Mode:

2437 MHz	20.0	18.6	17.1	18.5	22.9	7.77	30.7	1.164
Output power with three radios operating in 802.11g MIMO mode:					27.66	7.77	35.4	3.493

Client: Xirrus	Job Number: J71456
Model: XN-16 and XN-8	T-Log Number: T71643
	Account Manager: Susan Pelzi

802.11n 20MHz - triple chain (EIRP assumes no coherency between chains, effective antenna gain is x1)

Frequency (MHz)	Software Setting	Output Power (dBm)				Antenna Gain (dBi)	EIRP ^{Note 2}	
		A	B	C	Total		dBm	W
2412 MHz	13.0	11.7	10.8	9.7	15.6	3.0	18.6	0.072
2437 MHz	20.0	18.4	17.5	18.6	23.0	3.0	26.0	0.395
2462 MHz	9.5	8.2	6.8	8.1	12.5	3.0	15.5	0.036
Output power with three radios operating in 802.11n20 MIMO mode:					27.7	3.0	30.7	1.184

802.11n 40MHz - triple chain (EIRP assumes no coherency between chains, effective antenna gain is x1)

Frequency (MHz)	Software Setting	Output Power (dBm)				Antenna Gain (dBi)	EIRP ^{Note 2}	
		A	B	C	Total		dBm	W
2422 MHz	8.0	7.2	6.0	6.2	11.3	3.0	14.3	0.027
2437 MHz	20.0	18.4	17.2	17.7	22.6	3.0	25.6	0.360
2452 MHz	9.0	7.7	6.7	7.7	12.2	3.0	15.2	0.033

5.7GHz Band

There are five non-overlapping 20MHz channels and three non-overlapping 40MHz channels in this band. The power measurements below cover the cases where there is only one radio operational in the 5.7GHz band and where there are the maximum number of radios (5x20MHz channel or 3x40MHz channel) operating in the band. For all modes the single radio power level can be used regardless of the number of radios operational in the band.

802.11a - single chain

Power Setting ²	Frequency (MHz)	Output Power		Antenna Gain (dBi)	EIRP ^{Note 2}	
		(dBm) ¹	mW		dBm	W
17	5745	14.6	28.8	6.0	20.6	0.115
17	5785	14.6	28.8	6.0	20.6	0.115
17	5825	15.1	32.5	6.0	21.1	0.129
5 radios in 802.11a mode:		22.1	162.5	6.0	28.1	0.647

802.11a - dual chain (EIRP assumes coherency between chains, effective antenna gain is x2)

Frequency (MHz)	Software Setting	Output Power (dBm)				Antenna Gain (dBi)	EIRP ^{Note 2}	
		A	B	C	Total		dBm	W
5745 MHz	17.0	14.7		13.7	17.2	9.0	26.2	0.421
5785 MHz	17.0	14.8		13.4	17.2	9.0	26.2	0.414
5825 MHz	17.0	15.3		13.6	17.5	9.0	26.5	0.451
Output power with five radios operating in 802.11a MIMO mode:					24.5	9.0	33.5	2.256

802.11n 20MHz - triple chain (EIRP assumes no coherency between chains, effective antenna gain is x1)

Frequency (MHz)	Software Setting	Output Power (dBm)				Antenna Gain (dBi)	EIRP ^{Note 2}	
		A	B	C	Total		dBm	W

RSS 210 and FCC 15.247 (DTS) Antenna Port Measurements Power, PSD, Bandwidth and Spurious Emissions

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 6/3/2008
 Test Engineer: Mehran Birgani
 Test Location: Chamber #2

Config. Used: -
 Config Change: -
 EUT Voltage: POE

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator. All measurements were made on a single chain.

All measurements have been corrected to allow for the external attenuators used.

Ambient Conditions:

Temperature: 16 °C
 Rel. Humidity: 39 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power	15.247(b)	Pass	802.11b: 19.5 dBm 802.11g: 18.4 dBm
2	PSD	15.247(d)	Pass	802.11b: -2.3 dBm/3kHz 802.11g: 1.1 dBm/3kHz
3	Minimum 6dB Bandwidth	15.247(a)	Pass	802.11b: 10.0 MHz 802.11g: 16.3 MHz

Run #1: Output Power
802.11b - Single Radio In the Band

Power Setting ²	Frequency (MHz)	Output Power		Antenna Gain (dBi)	Result	EIRP ^{Note 2}	
		(dBm) ¹	mW			dBm	W
18.0	2412	18.3	67.6	3.0	Pass	21.3	0.135
20.0	2437	19.5	89.1	3.0	Pass	22.5	0.178
18.5	2462	17.4	55.0	3.0	Pass	20.4	0.110

802.11g - Single radio in the band

Power Setting ²	Frequency (MHz)	Output Power		Antenna Gain (dBi)	Result	EIRP ^{Note 2}	
		(dBm) ¹	mW			dBm	W
13.5	2412	12.3	17.0	3.0	Pass	15.3	0.034
20.0	2437	18.4	69.2	3.0	Pass	21.4	0.138
13.5	2462	11.6	14.5	3.0	Pass	14.6	0.029

802.11b - Three radios on non-overlapping channels, note 3

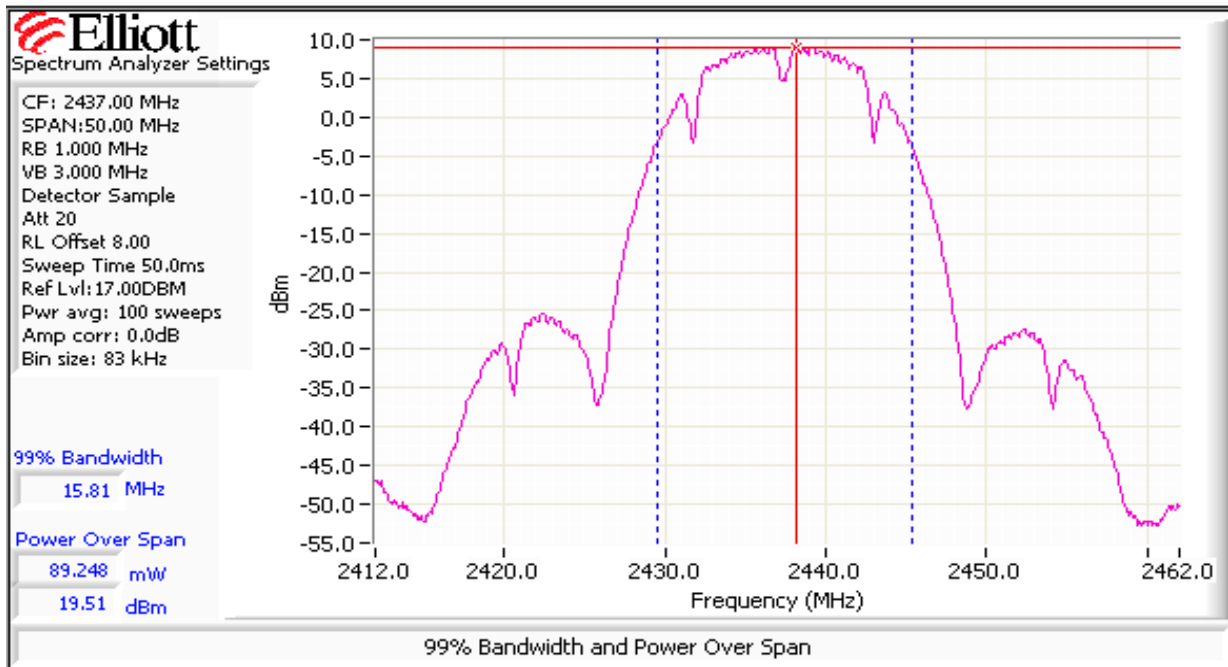

Power Setting ²	Frequency (MHz)	Output Power per radio		Total Power		Antenna Gain (dBi)	Result	EIRP ^{Note 2}	
		(dBm) ¹	mW	dBm	mW			dBm	W
20.0	2437	19.5	89.1	24.3	267.4	3.0	Pass	22.5	0.178

802.11g - Three radios on non-overlapping channels radio in the band, note 3

Power Setting ²	Frequency (MHz)	Output Power per radio		Total Power		Antenna Gain (dBi)	Result	EIRP ^{Note 2}	
		(dBm) ¹	mW	dBm	mW			dBm	W
20.0	2437	18.4	69.2	23.2	207.5	3.0	Pass	21.4	0.138

Note 1:	Output power measured using a spectrum analyzer (see plots below): RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was continuous) and power integration over 50 MHz. Spurious limit is -30dBc because this method was used. The output power limit is 30dBm.
Note 2:	Power setting - the software power setting used during testing, included for reference only.
Note 3:	The device has multiple radios, but the software limits operation in any band to ensure only non-overlapping channels are used (no two radios can operate on the same channel or on overlapping channels). In the 2412 - 2462 MHz band there can be a maximum of 3 radios active. The calculated total power (obtained by multiplying the output power on a single radio by the number of radios that can be operating in the band) demonstrates that, with 3 radios active, the total output power still complies with the limit.

Run #2: Power spectral Density
802.11b

Power Setting	Frequency (MHz)	PSD	Limit dBm/3kHz	Result
		(dBm/3kHz) ^{Note 1}		
18.0	2412	-3.9	8.0	Pass
20.0	2437	-2.3	8.0	Pass
18.5	2462	-4.7	8.0	Pass

802.11g

Power Setting	Frequency (MHz)	PSD	Limit dBm/3kHz	Result
		(dBm/3kHz) ^{Note 1}		
13.5	2412	-8.7	8.0	Pass
20.0	2437	1.1	8.0	Pass
13.5	2462	-10.9	8.0	Pass

Note 1:	Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PPSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.
Note 2:	The operation of multiple radios in the band does not affect power spectral density as radios cannot operate on overlapping channels.

MIMO and Smart Antenna Systems
Power, PSD, Bandwidth and Spurious Emissions

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 6/4/2008 Config. Used: -
 Test Engineer: Mehran Birgani Config Change: -
 Test Location: Chamber #2 EUT Voltage: POE

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator.

All measurements have been corrected to allow for the external attenuators used.

Ambient Conditions:

Temperature: 16 °C
 Rel. Humidity: 39 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power Chain A+B+C	15.247(b)	Pass	802.11b: 23.7 dBm 802.11g: 28.2 dBm
2	PSD Chain A+B+C	15.247(d)	Pass	802.11b: -0.5 dBm/3kHz 802.11g: 3.2 dBm/3kHz
3	Minimum 6dB Bandwidth	15.247(a)	Pass	802.11b: 9.6 MHz 802.11g: 16.4 MHz
3	99% Bandwidth	RSS GEN	Pass	802.11b: 15.8 MHz 802.11g: 17.1 MHz
4	Spurious emissions	15.247(b)	Pass	All signals were more than 30dB below the fundamental

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

802.11g	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	20.0	20.0	20.0					
Output Power (dBm) ^{Note 1}	18.6	17.1	18.5		27.7 dBm	0.584 W	28.2 dBm	0.665 W
Antenna Gain (dBi) ^{Note 2}	3.0	3.0	3.0		7.8 dBi		Pass	
eirp (dBm) ^{Note 2}	21.6	20.1	21.5		35.4 dBm	3.493 W		

Note 1:	Output power measured using a spectrum analyzer (see plots below) with RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was continuous) and power integration over 50 MHz (reference method 1 of FCC DA 02-2138 for U-NII devices, August 30, 2002). Spurious limit becomes -30dBc.
Note 2:	As there is coherency between chains the effective antenna gain is the sum of the individual antenna gains and the eirp is the product of the total power and the effective antenna gain
Note 3:	The device has multiple radios, but the software limits operation in any band to ensure only non-overlapping channels are used (no two radios can operate on the same channel or on overlapping channels). In the 2412 - 2462 MHz band there can be a maximum of 3 radios active. The calculated total power (obtained by multiplying the output power on a single radio by the number of radios that can be operating in the band) demonstrates that, with 2 or 3 radios active, the total output power still complies with the limit.

Run #2: Power spectral Density

Power Setting	Frequency (MHz)	PSD (dBm/3kHz) ^{Note 1}				Total	Limit dBm/3kHz	Result
		Chain 1	Chain 2	Chain 3	Chain 4			
17.5	2412 802.11b	-6.5	-5.5	-6.8		-1.5	8.0	Pass
20.0	2437 802.11b	-2.3	-0.5	-2.2		3.2	8.0	Pass
17.5	2462 802.11b	-5.6	-3.8	-5.2		0.0	8.0	Pass
14.5	2412 802.11g	-9.9	-1.4	-3.7		1.0	8.0	Pass
20.0	2437 802.11g	-1.0	3.2	-0.9		5.7	8.0	Pass
13.5	2462 802.11g	-8.2	-5.1	-9.6		-2.4	8.0	Pass

Note 1:	Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PPSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.
Note 2:	The operation of multiple radios in the band does not affect power spectral density as radios cannot operate on overlapping channels.

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 6/4/2008	Config. Used: -
Test Engineer: Mehran Birgani	Config Change: -
Test Location: Chamber #2	EUT Voltage: POE

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator.

All measurements have been corrected to allow for the external attenuators used.

Ambient Conditions: Temperature: 19 °C
 Rel. Humidity: 31 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power Chain A+B+C	15.247(b)	Pass	802.11n20: 23.0 dBm 802.11n40: 22.6 dBm
2	PSD Chain A+B+C	15.247(d)	Pass	n20: 7.4 dBm/3kHz n40: 6.4 dBm/3kHz
3	Minimum 6dB Bandwidth	15.247(a)	Pass	802.11n20: 17.8 MHz 802.11n40: 35.5 MHz
3	99% Bandwidth	RSS GEN	Pass	802.11n20: 18.3 MHz 802.11n40: 37.1 MHz
4	Spurious emissions	15.247(b)	Pass	All signals were more than 30dB below the fundamental

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Three radios on non-overlapping channels, note 3

802.11n20	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	20.0	20.0	20.0					
Output Power (dBm) ^{Note 1}	18.4	17.5	18.6		27.7 dBm	0.594 W	30.0 dBm	1.000 W
Antenna Gain (dBi) ^{Note 2}	3.0	3.0	3.0			-1.8 dBi	Pass	
eirp (dBm) ^{Note 2}	21.4	20.5	21.6		26.0 dBm	0.395 W		

- Note 1:** Output power measured using a spectrum analyzer (see plots below) with RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was continuous) and power integration over 50 MHz for 802.11n 20MHz and 80 MHz for 802.11n 40 MHz (reference method 1 of FCC DA 02-2138 for U-NII devices, August 30, 2002). Spurious limit becomes -30dBc.
- Note 2:** As there is no coherency between chains the total EIRP is the sum of the individual EIRPs and effective antenna gain equals the eirp divide by the sum of the power on each chain.
- Note 3:** The device has multiple radios, but the software limits operation in any band to ensure only non-overlapping channels are used (no two radios can operate on the same channel or on overlapping channels). In the 2412 - 2462 MHz band there can be a maximum of 3 radios active with all 3 using 20MHz channels (in 40MHz mode there can be only one 40MHz and one 20MHz channel used). The calculated total power (obtained by multiplying the output power on a single radio by the number of radios that can be operating in the band) demonstrates that the total output power still complies with the limit. The total power with one radio operating on a 20MHz channel and one on a 40MHz channel is lower than the power with three radios operating on 20MHz channels and is, therefore, not calculated.

Run #2: Power spectral Density

Power Setting	Frequency (MHz)	PSD (dBm/3kHz) ^{Note 1}				Total	Limit dBm/3kHz	Result
		Chain 1	Chain 2	Chain 3	Chain 4			
13.0	2412 802.11n20	-11.6	-2.7	-5.0	-0.4	8.0	Pass	
20.0	2437 802.11n20	4.5	2.8	-1.4	7.4	8.0	Pass	
9.5	2462 802.11n20	-11.1	-6.6	-14.8	-4.8	8.0	Pass	
8.0	2422 802.11n40	-17.6	-9.2	-10.5	-6.4	8.0	Pass	
20.0	2437 802.11n40	-3.6	5.1	-1.4	6.4	8.0	Pass	
9.0	2452 802.11n40	-17.2	-7.6	-7.1	-4.1	8.0	Pass	

Note 1:	Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PPSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.
Note 2:	The operation of multiple radios in the band does not affect power spectral density as radios cannot operate on overlapping channels.

RSS 210 and FCC 15.247 (DTS) Antenna Port Measurements Power, PSD, Bandwidth and Spurious Emissions

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 6/4/2008
 Test Engineer: Suhaila Khushzad
 Test Location: OATS # 1

Config. Used: 1
 Config Change: None
 EUT Voltage: POE

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator. All measurements were made on a single chain.

All measurements have been corrected to allow for the external attenuators used.

Ambient Conditions:

Temperature: 19 °C
 Rel. Humidity: 46 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power	15.247(b)	Pass	802.11a: 15.1 dBm
2	PSD	15.247(d)	Pass	802.11a: -8 dBm/3kHz
3	Minimum 6dB Bandwidth	15.247(a)	Pass	802.11a: 16.33 MHz
3	99% Bandwidth	RSS GEN	-	802.11a: 17.4 MHz
4	Spurious emissions	15.247(b)	Pass	All signal were more than 30dB below the fundamental

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Client: Xirrus	Job Number: J71456
Model: XN-16 and XN-8	T-Log Number: T71643
	Account Manager: Susan Pezli

Standard: -	Class: N/A

Run #1: Output Power
802.11a - Single Radio In the Band

Power Setting ²	Frequency (MHz)	Output Power		Antenna Gain (dBi)	Result	EIRP ^{Note 2}	
		(dBm) ¹	mW			dBm	W
17	5745	14.6	28.8	6.0	Pass	20.6	0.115
17	5785	14.6	28.8	6.0	Pass	20.6	0.115
17	5825	15.1	32.5	6.0	Pass	21.1	0.129

802.11a - Five radios on non-overlapping channels, note 3

Power Setting ²	Frequency (MHz)	Output Power per radio		Total Power		Antenna Gain (dBi)	Result	EIRP ^{Note 2}	
		(dBm) ¹	mW	dBm	mW			dBm	W
17	-	15.1	32.5	22.1	162.5	6.0	Pass	28.1	0.647

Note 1:	Output power measured using a spectrum analyzer (see plots below): RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was continuous) and power integration over 50 MHz. Spurious limit is -30dBc because this method was used. The output power limit is 30dBm.
Note 2:	Power setting - the software power setting used during testing, included for reference only.
Note 3:	The device has multiple radios, but the software limits operation in any band to ensure only non-overlapping channels are used (no two radios can operate on the same channel or on overlapping channels). In the 5745 - 5785 MHz band there can be a maximum of 5 radios active (5, non-overlapping 802.11a channels). The calculated total power (obtained by multiplying the output power on a single radio by the number of radios that can be operating in the band) demonstrates that, with 5 radios active, the total output power still complies with the limit.

**Run #2: Power spectral Density
802.11a**

Power Setting	Frequency (MHz)	PSD	Limit dBm/3kHz	Result
		(dBm/3kHz) ^{Note 1}		
17	5745	-10.0	8.0	Pass
17	5785	-9.8	8.0	Pass
17	5825	-8.0	8.0	Pass

Note 1: Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PPSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.

Note 2: The operation of multiple radios in the band does not affect power spectral density as radios cannot operate on overlapping channels.

Run #1: Output Power - Chain A + C

Transmitted signal on chain is coherent ? Yes

Single radio Operating in the Band

5745	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	17.0		17.0		Total Across All Chains		Limit	
Output Power (dBm) ^{Note 1}	14.7		13.7		17.2 dBm	0.053 W	27.0 dBm	0.500 W
Antenna Gain (dBi) ^{Note 2}	6		6		9.0 dBi		Pass	
eirp (dBm) ^{Note 2}	20.7		19.7		26.2 dBm	0.422 W		

5785	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	17.0		17.0		Total Across All Chains		Limit	
Output Power (dBm) ^{Note 1}	14.8		13.4		17.2 dBm	0.052 W	27.0 dBm	0.500 W
Antenna Gain (dBi) ^{Note 2}	6		6		9.0 dBi		Pass	
eirp (dBm) ^{Note 2}	20.8		19.4		26.2 dBm	0.415 W		

5825	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	17.0		17.0		Total Across All Chains		Limit	
Output Power (dBm) ^{Note 1}	15.3		13.6		17.5 dBm	0.057 W	27.0 dBm	0.500 W
Antenna Gain (dBi) ^{Note 2}	6		6		9.0 dBi		Pass	
eirp (dBm) ^{Note 2}	21.3		19.6		26.6 dBm	0.452 W		

Five radios on non-overlapping channels, note 3

-	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	17.0		17.0		Total Across All Chains		Limit	
Output Power (dBm) ^{Note 1}	15.3		13.6		24.5 dBm	0.284 W	27.0 dBm	0.500 W
Antenna Gain (dBi) ^{Note 2}	6		6		9.0 dBi		Pass	
eirp (dBm) ^{Note 2}	21.3		19.6		33.5 dBm	2.261 W		

Note 1:	Output power measured using a spectrum analyzer (see plots below) with RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was continuous) and power integration over 50 MHz (reference method 1 of FCC DA 02-2138 for U-NII devices, August 30, 2002). Spurious limit becomes -30dBc .
Note 2:	As there is coherency between chains the effective antenna gain is the sum of the individual antenna gains and the eirp is the product of the total power and the effective antenna gain
Note 3:	The device has multiple radios, but the software limits operation in any band to ensure only non-overlapping channels are used (no two radios can operate on the same channel or on overlapping channels). In the 5745 - 5785 MHz band there can be a maximum of 5 radios active (5, non-overlapping 802.11a channels). The calculated total power (obtained by multiplying the output power on a single radio by the number of radios that can be operating in the band) demonstrates that, with 5 radios active, the total output power still complies with the limit.

RSS 210 and FCC 15.247 (DTS) Antenna Port Measurements
MIMO and Smart Antenna Systems
Power, PSD, Bandwidth and Spurious Emissions

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 6/9/2008	Config. Used: -
Test Engineer: Mehran Birgani	Config Change: -
Test Location: Chamber #2	EUT Voltage: POE

General Test Configuration

The EUT was connected to the spectrum analyzer or power meter via a suitable attenuator.

All measurements have been corrected to allow for the external attenuators used.

Ambient Conditions:	Temperature:	19 °C
	Rel. Humidity:	36 %

Summary of Results

Run #	Test Performed	Limit	Pass / Fail	Result / Margin
1	Output Power Chain A+C	15.247(b)	Pass	802.11n20: 17.4 dBm 802.11n40: 17.2 dBm
2	PSD Chain A+C	15.247(d)	Pass	n20: -1.8 dBm/3kHz n40: -9.8 dBm/3kHz
3	Minimum 6dB Bandwidth	15.247(a)	Pass	802.11n20: 17.7 MHz 802.11n40: 36.4 MHz
3	99% Bandwidth	RSS GEN	Pass	802.11n20: 18.6 MHz 802.11n40: 37.0 MHz
4	Spurious emissions	15.247(b)	Pass	All signal were more than 30dB below the fundamental

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Five radios on non-overlapping channels, note 3

802.11n 20MHz	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	17.0		17.0					
Output Power (dBm) ^{Note 1}	15.0		13.6		24.4 dBm	0.273 W	30.0 dBm	1.000 W
Antenna Gain (dBi) ^{Note 2}	6.0		6.0			-1.0 dBi	Pass	
eirp (dBm) ^{Note 2}	21.0		19.6		23.4 dBm	0.217 W		

Two radios on 40 MHz non-overlapping channels, note 3

802.11n 40MHz	Chain 1	Chain 2	Chain 3	Chain 4	Total Across All Chains		Limit	
Power Setting ^{Note 3}	17.0		17.0					
Output Power (dBm) ^{Note 1}	11.8		13.5		18.8 dBm	0.075 W	30.0 dBm	1.000 W
Antenna Gain (dBi) ^{Note 2}	6.0		6.0			3.0 dBi	Pass	
eirp (dBm) ^{Note 2}	17.8		19.5		21.8 dBm	0.150 W		

Note 1:	Output power measured using a spectrum analyzer (see plots below) with RBW=1MHz, VB=3 MHz, sample detector, power averaging on (transmitted signal was continuous) and power integration over 50 MHz for 802.11n 20MHz mode and 80 MHz for 802.11n 40MHz mode (reference method 1 of FCC DA 02-2138 for U-NII devices, August 30, 2002). Spurious limit becomes -30dBc.
Note 2:	As there is no coherency between chains the total EIRP is the sum of the individual EIRPs and effective antenna gain equals the eirp divide by the sum of the power on each chain.
Note 3:	The device has multiple radios, but the software limits operation in any band to ensure only non-overlapping channels are used (no two radios can operate on the same channel or on overlapping channels). In the 5745 - 5785 MHz band there can be a maximum of 5 radios active (5, non-overlapping 20MHz channels) or 2 40 Mhz channels. The calculated total power (obtained by multiplying the output power on a single radio by the number of radios that can be operating in the band) demonstrates that, with 5 (or 2 for n40 mode) radios active, the total output power still complies with the limit.

Run #2: Power spectral Density

Power Setting	Frequency (MHz)	PSD (dBm/3kHz) ^{Note 1}				Total	Limit dBm/3kHz	Result
		Chain 1	Chain 2	Chain 3	Chain 4			
17.0	5745	-4.5		-9.9		-3.4	8.0	Pass
17.0	5785	-5.9		-8.2		-3.9	8.0	Pass
17.0	5825	-2.9		-8.1		-1.8	8.0	Pass
17.0	5755	-14.7		-12.3		-10.3	8.0	Pass
17.0	5795	-12.0		-13.8		-9.8	8.0	Pass

- Note 1: Power spectral density measured using RB=3 kHz, VB=10kHz, analyzer with peak detector and with a sweep time set to ensure a dwell time of at least 1 second per 3kHz. The measurement is made at the frequency of PPSD determined from preliminary scans using RB=3kHz using multiple sweeps at a faster rate over the 6dB bandwidth of the signal.
- Note 2: The operation of multiple radios in the band does not affect power spectral density as radios cannot operate on overlapping channels.

RSS 210 and FCC 15.247 (DTS) Radiated Spurious Emissions 2390 MHz and 2483.5 MHz Restricted Band Edges, Internal Antenna

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. All remote support equipment was located approximately 30 meters from the EUT with all I/O connections running on top of the groundplane.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions:

Temperature:	22 - 30 °C
Rel. Humidity:	29 - 35 %

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

RSS 210 and FCC 15.247 (DTS) Radiated Spurious Emissions, Internal Antenna

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. All remote support equipment was located approximately 30 meters from the EUT with all I/O connections running on top of the groundplane or routed in overhead in the GR-1089 test configuration.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions:

Temperature:	22 - 30 °C
Rel. Humidity:	29 - 35 %

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

RSS 210 and FCC 15.247 (DTS) Radiated Spurious Emissions 2390 MHz and 2483.5 MHz Band Edges - External Antenna

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. All remote support equipment was located approximately 30 meters from the EUT with all I/O connections running on top of the groundplane.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions:	Temperature:	22 °C
	Rel. Humidity:	24 %

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Summary of Results - Device Operating in the 2400-2483.5 MHz Band

Run #	Mode	Channel	Power Setting	Test Performed	Limit	Result / Margin
1a	802.11b	2412	18.0	Restricted Band Edge (2390 MHz)	FCC Part 15.209 / 15.247(c)	53.7dBµV/m (484.2µV/m) @ 2387.4MHz (-0.3dB)
1b		2462	18.5	Restricted Band Edge (2483.5 MHz)	FCC Part 15.209 / 15.247(c)	53.5dBµV/m (473.2µV/m) @ 2487.9MHz (-0.5dB)

RSS 210 and FCC 15.247 (DTS) Radiated Spurious Emissions, External Antenna

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. All remote support equipment was located approximately 30 meters from the EUT with all I/O connections running on top of the groundplane.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions:

Temperature: 22 °C
Rel. Humidity: 24 %

Date of Test: 5/22/2008
Test Engineer: Mehran Birgani
Test Location: SVOATS #2

Config. Used: 1
Config Change: None
EUT Voltage: POE

Summary of Results - Device Operating in the 2400-2483.5 MHz Band

Run #	Mode	Channel	Power Setting	Test Performed	Limit	Result / Margin

RSS 210 and FCC 15.247 (DTS) Radiated Spurious Emissions, External Antenna

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Summary of Results - Device Operating in the 5725-5850 MHz Band

Run #	Mode	Channel	Power Setting	Radio	Test Performed	Limit	Result / Margin
1a	802.11a External Antenna	5745	17	4	Radiated Emissions, 1 - 40 GHz	FCC Part 15.209 / 15.247(c)	45.5dBµV/m @ 17218.0MHz (-8.5dB)
1b		5785	17	4	Radiated Emissions, 1 - 40 GHz	FCC Part 15.209 / 15.247(c)	46.1dBµV/m @ 17363.5MHz (-7.9dB)
1c		5825	17	4	Radiated Emissions, 1 - 40 GHz	FCC Part 15.209 / 15.247(c)	46.8dBµV/m @ 17476.6MHz (-7.2dB)

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated spurious emissions testing. All remote support equipment was located approximately 30 meters from the EUT with all I/O connections running on top of the groundplane.

For radiated emissions testing the measurement antenna was located 3 meters from the EUT.

Ambient Conditions: Temperature: 19.4 °C
 Rel. Humidity: 45 %

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Note 1: The console port on the XN-16 was not connected during testing. This port is used for configuration and troubleshooting purposes only and is not intended to be connected during normal operation.

Note 2: The gigabit ethernet# 2, ethernet# 0 ports on the XN16 were not connected during testing. These ports were not exercised for this configuration

EUT Operation During Emissions Tests

During AC conducted emissions and harmonics and Flicker testing all 16 (*8 for the XS-8*) radios were transmitting at max power on the following channels: 2412 MHz 802.11b, 2472 MHz 802.11g, 2437MHz 802.11n20, 5180 MHz 802.11a, 5320 MHz 802.11n20, 5500 MHz 802.11n40, 5700 MHz 802.11a, 5825 MHz 802.11n20, 5745 MHz 802.11n 20, 5600 MHz n20, 2412 MHz 802.11n20, 2462 MHz 802.11n20, 5510MHz n40, 5690 MHz 802.11n40, 5240 MHz 802.11a, 5260 MHz 802.11a, 5280 MHz 802.11n20

During radiated emissions tests all 16 radios (*8 for the XS-8*) were in receive mode with all chains active on the following channels: 2437 MHz, 5200 MHz, 5280 MHz, 5600 MHz, 5785 MHz, 2412 MHz, 2472 MHz, 5180 MHz, 5320 MHz, 5500 MHz, 5700 MHz, 5785 MHz, 2462 MHz, 5240MHz,5260 MHz, 5540 MHz. Transmit mode emissions are covered by the relevant radio standards.

The ethernet interface was active for all tests and exercised via **??fast pings??** from the laptop PC connected to the ethernet port.

Radiated Emissions, XN8 and XN16, Digital Device/Receiver

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

General Test Configuration

The EUT and all local support equipment were located on the turntable for radiated emissions testing. Remote support equipment were located outside of chamber.

The test distance and extrapolation factor (if applicable) are detailed under each run description.

Note, **preliminary** testing indicates that the emissions were maximized by orientation of the EUT and elevation of the measurement antenna. **Maximized** testing indicated that the emissions were maximized by orientation of the EUT, elevation of the measurement antenna, and manipulation of the EUT's interface cables.

Ambient Conditions: Temperature: 18 °C
 Rel. Humidity: 48 %

Summary of Results

Run #	Test Performed	Limit	Result	Margin
1	RE, 30 - 1000MHz Maximized Emissions (XN8)	RSS GEN / FCC 15.107	Pass	44.8dBµV/m (173.8µV/m) @ 350.00MHz (-1.2dB)
		EN 55022 B	Pass	36.5dBµV/m @ 750.01MHz (-0.5dB)
2	RE, 30 - 1000MHz Maximized Emissions (XN16)	RSS GEN / FCC 15.107	Pass	44.2dBµV/m @ 349.999MHz (-1.8dB)
		EN 55022 B	Pass	36.0dBµV/m @ 349.999MHz (-1.0dB)

Modifications Made During Testing

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.

Conducted Emissions - Power Ports

Test Specific Details

Objective: The objective of this test session is to perform final qualification testing of the EUT with respect to the specification listed above.

Date of Test: 6/3/2008	Config. Used: 1
Test Engineer: Chris Groat	Config Change: none
Test Location: SVOATS #1	EUT Voltage: 230V/50Hz & 120V/60Hz

General Test Configuration

The EUT was located on a wooden table, 40 cm from a vertical coupling plane and 80cm from the LISN. A second LISN was used for all local support equipment. Remote support equipment was located approximately 30 meters from the test area. All I/O connections were routed overhead.

Ambient Conditions: Temperature: 23 °C
 Rel. Humidity: 43 %

Summary of Results

Run #	Test Performed	Limit	Result	Margin
1	CE, AC Power, 230V/50Hz Model XN16	EN 55022 Class B	Pass	41.3dBµV @ 0.469MHz (-5.2dB)
2	CE, AC Power, 120V/60Hz Model XN16	FCC 15.109 Class B FCC 15.209 RSS GEN	Pass	42.8dBµV @ 4.670MHz (-3.2dB)
3	CE, AC Power, 230V/50Hz Model XN8	EN 55022 Class B		Covered by XN16 as worst case
4	CE, AC Power, 120V/60Hz Model XN8	FCC 15.109 Class B FCC 15.209 RSS GEN		Covered by XN16 as worst case

Modifications Made During Testing

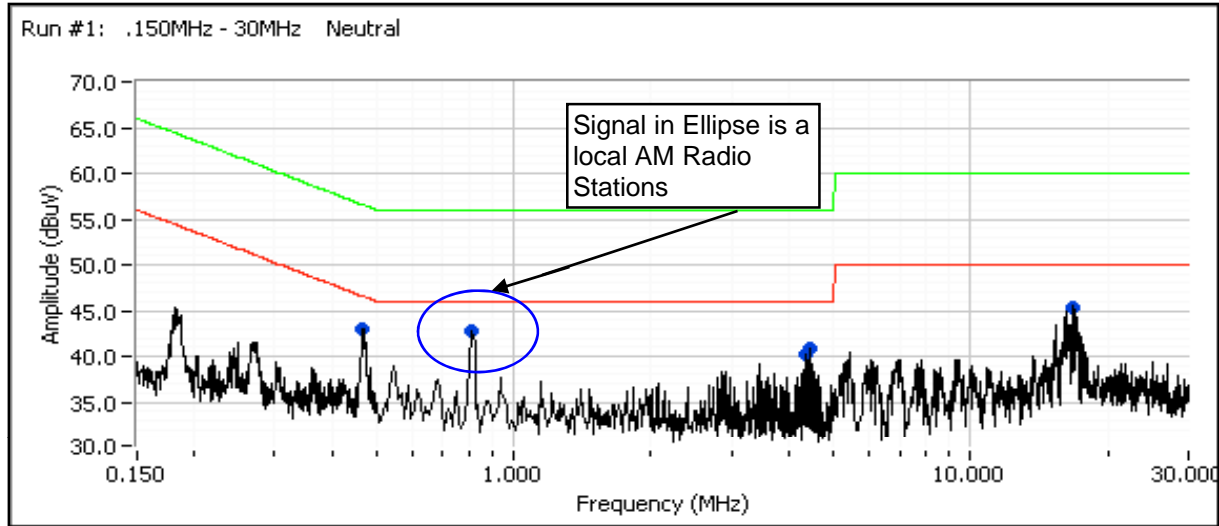

No modifications were made to the EUT during testing

Deviations From The Standard

No deviations were made from the requirements of the standard.
