RE: Xirrus Model XS-3500

Dear Examiner:

The Xirrus Model XS-3500 product software is designed so that a user cannot select channels in the 2.4GHz band that are less than 20MHz apart. This feature inhibits the end user from selecting overlapping channels in this band.

The XS-3500 software also monitors the total output power in the lower UNII band and insures that the total aggregate output power in the band remains below the 50mW FCC limit.

Sincerely,

XIRRUS, INC.
