1.4.2 Modes of Operation

The EUT was evaluated in the TX Mode.

The BLE radio was set to 37 bytes PRBS9 payload leading to a transmission duty cycle of 65.4%. The EUT TX output power was not configurable via the GUI test application. The EUT was operating at the maximum TX Output Power per the equipment manufacturer.

1.4.3 Monitoring of Performance

The EUT was evaluated while connected to a laptop computer via a USB to UART interface for testing purposes.

Preliminary radiated emissions evaluations were performed for the EUT in three orthogonal orientations. The test report documents the results for the EUT orientations leading to the highest emissions with respect to the limits as described below:

- EUT Standing - Worst for Radiated Band-Edge Emissions
- EUT on Side - Worst for Radiated Spurious Emissions

The RF conducted emissions were performed on a sample modified with an SMA connector at the antenna port.

The EUT is standalone battery operated without any provision for connection to external power sources. The EUT is exempted from the power line conducted emissions requirements.

1.4.4 Performance Criteria

The report documents the compliance of the BLE radio with the FCC Section 15.247 and ISSED Canada RSS-247 requirements. A summary of the parameters that were evaluated is provided below.

2.7 Radiated Spurious Emissions into Restricted Frequency Bands

2.7.1 Specification Reference

2.7.2 Equipment Under Test and Modification State

N/A

2.7.3 Date of Test

12/16/2019 to 12/17/2019

2.7.4 Test Method

Radiated emissions tests were made over the frequency range of 9 kHz to 26 GHz, 10 times the highest fundamental frequency. Each emission found to be in a restricted band as defined by section 15.205, including any emission at the operational band-edge, was compared to the radiated emission limits as defined in Section 15.209.

For measurements below 30 MHz, the receive antenna height was set to 1 m and the EUT was rotated through 360 degrees. The resolution bandwidth was set to 200 Hz below 150 kHz and to 9 kHz above 150 kHz.

The EUT was rotated through 360° and the receive antenna height was varied from 1m to 4m so that the maximum radiated emissions level would be detected. For frequencies below 1000 MHz, quasi-peak measurements were made using a resolution bandwidth RBW of 120 kHz and a video bandwidth VBW of 300 kHz. For frequencies above 1000 MHz, peak measurements are made with RBW of 1 MHz and VBW of 3 MHz. Average measurements are performed in the linear scale using VBW of 3 kHz.

2.7.8 Sample Calculations

$$R_c = R_u + CF_T$$

Where:

CF_T	=	Total Correction Factor (AF+CA+AG)-DC (Average Measurements Only)
R_u	=	Uncorrected Reading
R_c	=	Corrected Level
AF	=	Antenna Factor
CA	=	Cable Attenuation
AG	=	Amplifier Gain
DC	=	Duty Cycle Correction Factor

Example Calculation: Peak

Corrected Level: $63.94 + (-2.12) = 61.82 \text{ dB}\mu\text{V/m}$

Margin: $74 \text{ dB}\mu\text{V/m} - 61.82 \text{ dB}\mu\text{V/m} = 12.18 \text{ dB}$

Example Calculation: Average

Corrected Level: $44.57 + (-2.12) - 0 = 42.45 \text{ dB}\mu\text{V/m}$

Margin: $54 \text{ dB}\mu\text{V/m} - 42.45 \text{ dB}\mu\text{V/m} = 11.55 \text{ dB}$

2.8.4 Test Method

The power spectral density was measured in accordance with ANSI C63.10 Subclause 11.10.2 Method PKPSD (peak PSD). The RF output port of the EUT was directly connected to the input of the spectrum analyzer. Offset values were input for cable and external attenuation. The spectrum analyzer RBW was set to 3 kHz and VBW to 10 kHz. The Span was adjusted to 1.5 times the DTS bandwidth and the sweep time was set to auto. The measurements were performed using a Peak detector.
