## **RF Exposure Letter**

According to 447498 D01 General RF Exposure Guidance v05 The 1  $^{-}$  g and 10  $^{-}$  g SAR test

exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by: [(max. power of channel, including tune - up tolerance, mW)/(min. test separation distance, mm)] • [ $\sqrt{f(GHz)}$ ]  $\leq$  3.0 for 1 - g SAR and  $\leq$  7.5 for 10 - g extremity SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest  $\ensuremath{\mathsf{mW}}$  and  $\ensuremath{\mathsf{mm}}$  before calculation

The result is rounded to one decimal place for comparison

pt=4.24dBm=2.6546mW at 2440MHz

So  $(2.6546 \text{mW/5mm})x \sqrt{2.440 \text{GHz}} = 0.8293 < 3$ 

Then SAR evaluation is not required
