Subject: EMC Test and Measurement Report for  
Model 800 RFID Tag Reader / Writer

Dear Mr. Kranz:

We have provided with this letter your EMC Test Report for the above referenced model. The product was determined to comply with the requirements noted in the report.

Please review the attached report and direct any questions or comments to me.

We appreciate your interest in UL's EMC Services, and encourage you to contact us in the future should you need EMC test services. This closes Project 04CA44983.

Best regards,

A handwritten signature in black ink that reads "Bart Mucha".

# EMC – TEST REPORT

Issue Date: November 24, 2004

## ✓ EMISSIONS IMMUNITY

Test Report File No. : MC2255  
Project No. : 04CA44983

Model / Type : 800  
Kind of Product : RFID Tag Reader / Writer

Applicant : Stemco LLC  
License Holder : Stemco LLC  
Address : Box 1989  
: 300 Industrial Blvd.  
: Longview, TX 75606  
Manufacturer : Same as Applicant

**Test Result : COMPLIANT**

This report without appendices consists of 19 pages. Appendix A contains test photos, Appendix B contains original test data and Appendix C contains sample calculations.

The data contained in this report reflects only the items tested in the configurations and mode of operations described. An attempt has been made to arrange the EUT, with the equipment provided, into a test configuration which maximizes the observed emissions of the EUT while simulating, as close as practical, a typical end-use installation. The photos and data provided in this report document that configuration.

Underwriters Laboratories Inc. authorizes the above company to reproduce  
this report provided it is reproduced in its entirety.

# REPORT DIRECTORY

## SECTION    TITLE

### **GENERAL**

- 1.0 General Product Description
- 1.1 Model Differences
- 1.2 Environmental Conditions in Test Lab
- 1.3 Calibration Details of Equipment Used for Measurement
- 1.4 EUT (Equipment Under Test) Configuration
- 1.5 EUT Operating Mode
- 1.6 Device Modifications
- 1.7 Test Facility Description

### **EMISSIONS**

- 2.0 Emission Measurements
- 2.1 Spurious Radiated Electric Field Emissions
- 2.2 Carrier Frequency Separation
- 2.3 Channel Bandwidth (20dB)
- 2.4 Number of Hopping Channels
- 2.5 Average Channel Occupancy Time and Channel Period
- 2.6 RF Conducted Peak Output Power
- 2.7 Reduced Output Gain if Directional Gain Exceeds 6dBi
- 2.8 Antenna Terminal Conducted Measurements
- 2.9 Band Edge – Spurious Emissions

### **CONCLUSION**

- 3.0 General Remarks
- 3.1 Summary

### **APPENDICIES**

- A Test Setups (Photos, Diagrams and Drawings)
- B Test Data
- C Sample Calculations

## 1.0 GENERAL PRODUCT DESCRIPTION

The Equipment Under Test (EUT) was a RFID TAG Reader / Writer operating in frequency rage of 2400MHz - 2483.5MHz (spread-spectrum, frequency hopper).

### 1.0.1 Equipment Mobility:

Portable

### 1.0.2 Test Voltage and Frequency:

<u>Voltage (V)</u>	<u>Frequency (Hz)</u>
7.2	DC

## 1.1 MODEL DIFFERENCES

**Any other model(s) represented by the models tested in this investigation will be documented by the manufacturer.**

## 1.2 ENVIRONMENTAL CONDITIONS IN TEST LAB

Temperature: 20-25 °C  
Relative Humidity: 30-60% RH  
Atmospheric Pressure: 860-1060 mbar

## 1.3 CALIBRATION OF EQUIPMENT USED FOR MEASUREMENT

All test equipment and test accessories are calibrated on a regular basis. The maximum time between calibrations is one year or what is recommended by the manufacturer, whichever is less.

All test equipment calibrations are traceable to the National Institute of Standards and Technology (NIST), therefore, all test data recorded in this report is traceable to NIST.

## 1.4 EUT CONFIGURATION(s)

See Appendix A for individual set-up configuration(s). In addition to the EUT, the following peripheral devices and/or cables were connected during the measurement:

<b>Description of Test System</b>				
<b>Device</b>	<b>Manufacturer</b>	<b>Model</b>	<b>Serial #</b>	<b>FCC ID</b>
EUT	Stemco	800	-	SNV-800 0000

<b>Antenna(s) Employed</b>				
<b>Antenna Type</b>	<b>EUT Output Power</b>	<b>Antenna Gain</b>	<b>Total EIRP</b>	<b>Exposure Category</b>
PCB	9.31dBm	2.809dBi	12.119dBm	Portable

The antenna in the handheld reader model 800-0000 is fixed to the main processor board through soldered connections and cannot be removed or changed by the customer.

The antennas are made up of 2 half wave patches with 2.809 dBi of gain. (15.203 statement)

## 1.5 EUT OPERATING MODE(s)

**The equipment under test was operated during the measurements under the following conditions:**

Continuous operation, transmitter operating at low, mid and high channels at maximum rated power.

## 1.6 DEVICE MODIFICATIONS

**The following modifications were necessary for compliance:**

None.

## 1.7 TEST FACILITY DESCRIPTION

### Location of Test Site

Underwriters Laboratories Inc.  
333 Pfingsten Road  
Northbrook, IL 60062

**FCC Site Number: 31040/SIT 1300F2**

### 10-Meter Semi-Anechoic Chamber

The 10-meter semi-anechoic chamber, constructed by Lindgren RF Enclosures, is accredited for 10 or 3-meter final radiated emission measurements. The room consists of a 17.9 by 12 by 8.3-meter shield room lined with a hybrid absorber system manufactured by TDK. The walls, floor (conducting ground plane) and ceiling are constructed of double sided galvanized sheet steel supported by 3/4 inch particleboard. The interior walls and ceiling are covered with 10 by 10 cm, 6-mm thick ferrite tiles (TDK Type X191 100x100x6.0) and polystyrene absorber cones (TDK Type IP-090B).

The 10-meter chamber is provided with a 2.4 by 3-meter (width by height) door and a 4-meter diameter embedded turntable (Sunol Sciences Corp., Model FM4066). The turntable is provided with approximately 125 silver-graphite contacts with copper-beryllium springs mounted on adjustable brackets (see Figure 3) to provide continuity of the conducting ground plane. The turntable is mounted flush with the ground plane. The turntable is provided with a hole in the center for passage of the power and associated cables. Electrical power to the 10 meter and compact chambers is EMI filtered. The turntable and chamber floor are rated 14,000 and 10,000 lbs. respectively.

Two antenna masts are provided for measurement purposes. The antenna masts are pre-manufactured, portable units capable of remotely adjusting the antenna height from one to 4 meters above the conducting ground plane. The antenna masts are constructed of nonmetallic materials with the exception of the drive motors, which raise and lower the antennas.

The test equipment control station is located adjacent to the 10-meter chamber. The test equipment is connected to the chamber by double-shielded coaxial cables. The coaxial cables and control cable for the turntable and antenna mast are fed to connector ports on the outside of the chamber below the conducting ground plane. The cables are routed through a crawl space located under the chambers ground plane.

The EUT, turntable and antenna masts are monitored at the control station via fiber optic video system.

## **2.0 EMISSIONS TEST REGULATIONS**

Emissions testing was performed according to the following regulations:

The Digital Part of the device

47 CFR Part 15.109 Subpart B: July 12, 2004 + ANSI C63.4 - 2000

The Radio Part of the device

47 CFR Part 15.247 Subpart C: July 12, 2004 + ANSI C63.4 - 2000

15.247 – Spread-spectrum devices operating within the bands 902-928MHz,  
2400-2483.5MHz, and 5725-5850MHz

Testing was covered / required as noted below:

<b>Test / Requirement</b>	<b>Reference</b>	<b>Result</b>	<b>Remarks</b>
Conducted Voltage (AC Power Line)	15.207	NA	EUT is battery operated and is not operational when charger is attached. Per the manufacturer request testing was not conducted.
Spurious Radiated Emissions	15.209 and 15.247(d)	Compliant	
Carrier Frequency Separation	15.247(a)(1)	Compliant	The average channel separation was found to be 1.068MHz
Channel Bandwidth (20dB)	15.247(a)(1)	NA	Maximum bandwidth measured was 99.198kHz
Number of Hopping Channels	15.247(a)(1)(iii)	Compliant	The total number of hopping channels for this system is 76
Average Channel Occupancy Time and Channel Period	15.247(a)(1)(iii)	Compliant	The average channel occupancy time is 355.377ms and the maximum channel period is 33.28sec.
RF Conducted Peak Output Power	15.247(b)(1)	Compliant	Maximum measured power was 0.00853 watts
Reduced output if directional gain exceeds 6dBi	15.247(b)(4)	N/A	Not applicable. Antenna employed in EUT has directional gain less than 6dBi.
Spurious emissions (RF conducted & radiated)	15.247(d)	Compliant	
Channel Use	15.247(g)	Compliant	See Manufacturer Statement
Channel Avoidance	15.247(h)	Compliant	See Manufacturer Statement
Band-Edge Spurious Emissions	15.209 and 15.247(d)	Compliant	
RF Safety (SAR for portable devices)	15.247(i)		<b>See statement in User's Manual</b>

\* Since the transmitter operates over a frequency range greater than 10MHz, measurements were performed on low, mid and high channels per 15.31(m).

## 2.1 SPURIOUS RADIATED ELECTRIC FIELD EMISSIONS

### Test Location

10 Meter Semi-Anechoic Chamber

### Requirement

15.209 and 15.247(d)

### UL Procedure

3014ANBK-LPG-002

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Hewlett Packard Model 8566B Spectrum Analyzer (30-1000MHz)

Model 85650A Quasi-peak Adapter

Model 85685A RF Preselector No. EMC4015

Last Cal. 1-8-04, Next. Cal. 1-8-05

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

### Antennas

Chase EMC Ltd., Biconical Antenna Model VBA6106A, EMC4078

Last Cal. 07-09-04 Next. Cal. 07-09-05

Chase EMC Ltd., Log Periodic Antenna Model UPA6108, EMC 4076

Last Cal. 07-15-04, Next. Cal. 07-15-05

Characterized and Calibrated ULBOMS Antenna Array

Last Cal. 07/2004 Next Cal. 07/2005

### Frequency Range of Measurement

30MHz-25,000MHz

### Measurement Distance

3 meters and 10 meters

### Operating Mode

The unit was tested in its dominant modulation mode where maximum spurious products are produced for the longest durations. The unit was then tested in Low, Mid, and High bands. Though the unit does have second modulation, the carrier power is reduced thus producing lower spurious products.

### Test Results

The requirements are:

MET

Remarks

Since the unit is considered “portable”, therefore all scans and measurements were conducted with the unit in three possible axis - X, Y, and Z. In addition, worst-case axis spurious emissions, which fell in the restricted bands and were within 6dB of the general limit based on the pre-scan plot were measured to assure compliance with the general limits.

See App. B for complete test result.

## 2.2 CARRIER FREQUENCY SEPARATION

### Test Location

Open laboratory area

### Requirement

15.247(a)(1) - Frequency hopping systems shall have hopping channel carrier frequencies separated by minimum of 25kHz or the 20dB bandwidth of the hopping channel, whichever is greater.

### Operating Mode

Transmitter hopping all channels with modulation

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

### Test Results

The requirements are:

MET

### Remarks

See App. B for complete test results. For the purpose of this test, all channels frequencies were measured, the separation distance was found and averaged.

**The average channel separation was found to be 1.068MHz**

## 2.3 CHANNEL BANDWIDTH (20dB)

### Test Location

Open laboratory area

### Requirement

15.247(a)(1)

This measurement is necessary to obtain proper RBW and VBW information.

### Operating Mode

For the purpose of this test, only the bandwidth of three channels was measured: low channel, middle channel and high channel with modulation.

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

### Test Results

The requirements are:

N/A

Low Channel Bandwidth Measured: **84.168kHz**

Middle Channel Bandwidth Measured: **99.198kHz**

High Channel Bandwidth Measured: **99.198kHz**

### Remarks

See App. B for complete test results.

## 2.4 NUMBER OF HOPPING CHANNELS

### Test Location

Open laboratory area

### Requirement

15.247(a)(1)(iii)

Frequency hopping systems in the 2400 – 2483.5 MHz band should use at least 15 channels.

### Operating Mode

Transmitter hopping all channels with NO modulation

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

### Test Results

The requirements are:

MET

**The total number of hopping channels for this system is 76**

### Remarks

For purpose of this test, a scan in the frequency range 2400MHz – 2483.5MHz was made. Number of peaks and frequency of every peak was measured.

See App. B for complete test results.

## 2.5 AVERAGE CHANNEL OCCUPANCY TIME AND CHANNEL PERIOD

### Test Location

Open laboratory area

### Requirement

15.247(a)(1)(iii)

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

### Operating Mode

Transmitter hopping all channels with modulation

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

### Test Results

The requirements are:

MET

Low Channel Average Occupancy Time: **352.71mS**

Low Channel Period: **32.75s**

Middle Channel Average Occupancy Time: **360.72mS**

Middle Channel Period: **33.36s**

High Channel Average Occupancy Time: **360.72mS**

High Channel Period: **33.36s**

Minimum period: 30.4 seconds

### Remarks

For purpose of this test, the low, middle, and high channel occupancy time were captured. The occupancy time was based on single measurement. The channel period was based on the following information:

- The Reader/Writer will only transmit on four channels per activation
- The minimum time between activations is 330ms (limited by software)

See App. B for complete test results.

## 2.6 RF CONDUCTED PEAK OUTPUT POWER

### Test Location

Open laboratory area

### Requirement

15.247(b)(1)

For frequency hopping systems operating in the 2400 – 2483.5 MHz band employing at least 75 non-overlapping hopping channels: 1 watt.

### Operating Mode

For the purpose of this test, only the power of three channels was measured: low channel, middle channel and high channel with NO modulation.

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

### Test Results

The requirements are:

MET

For the purpose of this test, the peak power was measured in dBuV at low, middle and high channels. The measured value then was converted to watts.

Low Channel Maximum Power: **0.00853 Watts**

Middle Channel Maximum Power: **0.00726 Watts**

High Channel Maximum Power: **0.00705 Watts**

### Remarks

See App. B for complete test results.

**2.7 REDUCED OUTPUT IF DIRECTIONAL GAIN EXCEEDS 6dBi**

Requirement

15.247(b)(4)

Remarks

Antenna employed in EUT has directional gain less than 6dBi.

## 2.8 SPURIOUS EMISSIONS (CONDUCTED)

### Test Location

Open laboratory area

### Requirement

15.247(d)

### Operating Mode

Transmitter hopping all channels with modulation

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

with characterized set of attenuators, adapters and cables

### Frequency Range of Measurement

30MHz – 25GHz

### Test Results

The requirements are:

MET

### Remarks

See App. B for complete test results.

## 2.9 BAND EDGE - SPURIOUS EMISSIONS

### Test Location

Open Laboratory area

### Requirement

12.247(d)

In any 100kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by intentional radiator shall be at least 20dB below that in the 100kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.

### Test Instruments

Spectrum Analyzer / Quasi-peak Adapter / Preamplifier / Preselector

Rhode & Schwartz Model FSEK Spectrum Analyzer EMC4182 (1-10GHz)

Last Cal. 1-8-04, Next. Cal. 1-8-05

### Frequency Range of Measurement

2400MHz – 2483.5MHz

### Operating Mode

Transmitter hopping all channels with modulation

### Test Results

The requirements are:

MET

### Remarks

For the purpose of this test a conducted scan was done in the frequency range of 2380MHz – 2503.5MHz. Low band-edge and High band-edge frequencies were measured and their level compared to the maximum recorded power. In addition radiated scans were conducted to show that all levels at the band edges are under the appropriate limit.

Maximum Power Recorded: **116.31dBuV**

Low Band-edge Frequency: **2399.057MHz**

Low Band-edge Level: **76.41dBuV**

High Band-edge Frequency: **2484.195MHz**

High Band-edge Level: **71.15dBuV**

See App. B for complete test results.

### 3.0 GENERAL REMARKS

## **APPENDIX C**

### **Sample Calculations of Field Strengths**

#### **Basic Equation:**

The field strength is calculated by adding the Meter Reading, Cable Set Gain/Loss and Transducer (Antenna or LISN) Factor. The basic equation is as follows:

$$\text{FS} = \text{MR} + \text{GL} + \text{TF}$$

Where:

FS = Calculated Field Strength in dB(uV)/meter

MR = Meter Reading of receiver amplitude in dB(uV)

GL = Gain/Loss factor of cable set in dB

A negative Gain/Loss indicates signal amplification (gain)

A positive Gain/Loss indicates signal attenuation (loss)

TF = Transducer Factor of antenna or LISN in dB

#### **Sample Calculation:**

The measured receiver amplitude is 52.7 dB(uV).

The gain/loss factor is -30.2 dB (indicating a preamplifier is included in the cable set).

The transducer factor (antenna factor) is 6.6 dB.

These factors are added ( $52.7 + (-30.2) + 6.6$ ) resulting in a calculated field strength of 29.1 dB(uV)/meter.
