## 1.4 Measurement uncertainty

The treatment of uncertainty is based on the general matters on the definition of uncertainty in “Guide to the expression of uncertainty in measurement (GUM)” published by ISO. The Lab’s uncertainty is determined by referring UKAS Publication LAB34: 2002 “The Expression of Uncertainty in EMC Testing” and CISPR16-4-2: 2003 “Uncertainty in EMC Measurements”.

The uncertainty of the measurement result in the level of confidence of approximately 95% (k=2) is as follows;

RF frequency:  $\pm 1 \times 10^{-7}$

RF power conducted:  $\pm 1.0$  dB

AC power line emission:  $\pm 1.9$  dB

Radiated emission (30 MHz - 1000 MHz):  $\pm 5.7$  dB

Radiated emission (1 GHz - 20 GHz):  $\pm 5.8$  dB

Temperature:  $\pm 1$  degree

Humidity:  $\pm 5$  %

### Test Method

Substitution method is used for this test.

- a) EUT is set on non-conducting turntable and the output power is set to the maximum level.
- b) As a receive antenna, Horn antenna is used for high frequency range (above 1GHz), and Biological antenna is used for low frequency range (30MHz to 1GHz).

  - Turntable is rotated 360 degrees.
  - The height of receive antenna is changed from 1m to 4m.
  - Receive antenna polarization is set to vertical and horizontal.This maximum peak power is recorded.

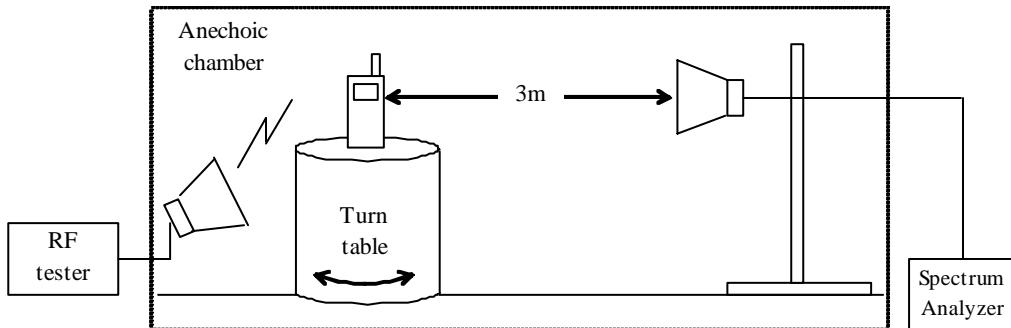

During this measurement, receive antenna is adjusted the direction to keep the EUT within the beamwidth of receive antenna.
- d) Reference antenna is replaced with EUT, and connected with signal generator (SG).

SG output power is adjusted to get same level as the recorded maximum radiated EUT power by SA.

Relative humidity: 56 %  
Test Voltage: 120 VDC (AC charger)

### Test Sample

Configuration I

### Test Method

Substitution method is used for this test.

- a) EUT is set on non-conducting turntable and the output power is set to the maximum level.
- b) As a receive antenna, Horn antenna is used for high frequency range (above 1GHz), and Biological antenna is used for low frequency range (30MHz to 1GHz).
- c) The maximum level of each spurious emission is measured by a spectrum analyzer (SA) in below conditions.

Turntable is rotated 360 degrees.

The height of receive antenna is changed from 1m to 4m.

Receive antenna polarization is set to vertical and horizontal.

EUT was placed at three different orientations (X, Y and Z axis) in order to find the worst orientation.

This emission level is recorded.

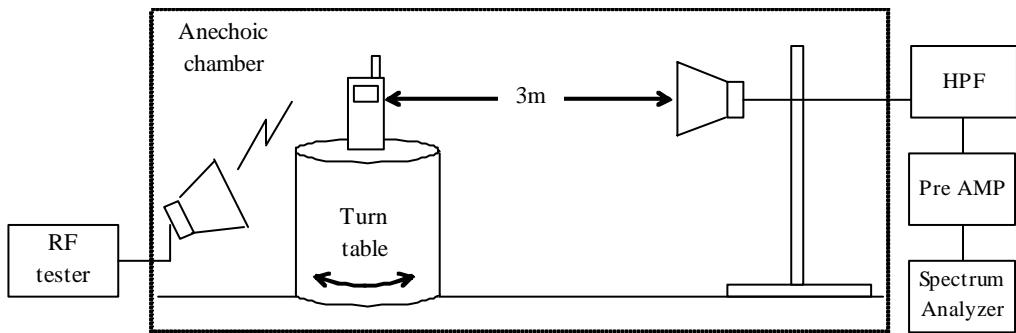

During this measurement, receive antenna is adjusted the direction to keep the EUT within the beamwidth of receive antenna.

- d) Reference antenna is replaced with EUT, and connected with signal generator (SG). SG output power is adjusted to get same level as the recorded maximum radiated EUT power by SA.
- e) Radiated output power ( $P_{out}$ ) is calculated with adjusted SG output ( $P_{sg}$ ) [dBm], reference antenna gain ( $G_{ref}$ ) [dBd] and cable loss between SG and reference antenna ( $L_{cab}$ ) [dB].

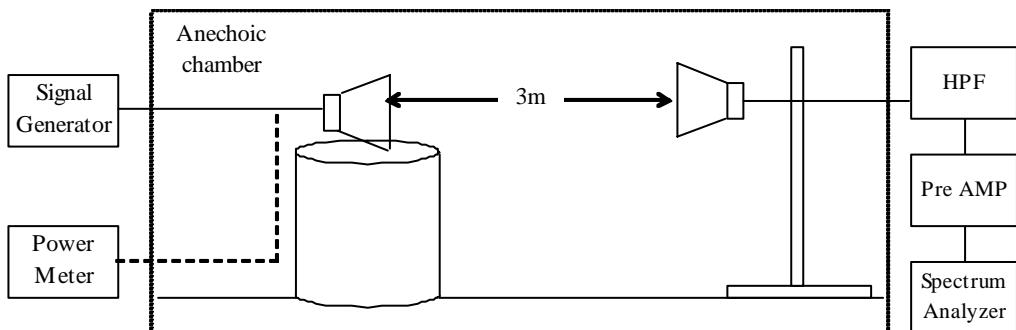

$$P_{out} [\text{dBm e.r.p}] = P_{sg} + G_{ref} + L_{cab}$$

## 2.3 Maximum Permissible Exposure (*Exposure of Humans to RF Fields*)

### Limitation

15.247(i) systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the Commission's guidelines.

See 1.1307(b) (1) of this Chapter.

1.1310 The criteria of "General Population/ Uncontrolled Exposure" listed in the below table shall be used to evaluated the environmental impact of human exposure to radio-frequency radiation as specified in 1.1307(b), except in the case of portable devices which shall be evaluated according to the previsions of 2.1093 of this chapter.

### Limits for General Population/Uncontrolled Exposure

Frequency Range (MHz)	Electric Field Strength (E) (V/m)	Magnetic Field Strength (H) (A/m)	Power Density (S) (mW/cm <sup>2</sup> )	Averaging Time  E  <sup>2</sup> ,  H  <sup>2</sup> or S (minutes)
0.3-1.34	614	1.63	(100)*	30
1.34-30	824/f	2.19/f	(180/f <sup>2</sup> )*	30
30-300	27.5	0.073	0.2	30
300-1500	--	--	f/1500	30
1500-100,000	--	--	1.0	30

f = frequency in MHz

\*Plane-wave equivalent power density

NOTE 2: **General population/uncontrolled** exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

### The MPE distance calculations:

The Maximum Permissible Exposure (MPE) distance between the EUT's antenna and human body is calculated in accordance with FCC OET Bulletin 65 and Safety Code 6 of IC.

The MPE distance where the exposure level reaches the permitted exposure level can be calculated as bellow;

$$S = P * G / 4\pi R^2$$

Rearranging terms to calculate the MPE Distance

$$R = (P * G / 4\pi S)^{1/2}$$

Where:

R = MPE Distance in cm

P = Power in dBm (213.8 mW (848.8 MHz), Refer to page 10 in this report)

G = Antenna Gain in numeric

(1 = 0dB<sub>i</sub>, Max. Antenna Gain)

S = Power Density Limit in mW/cm<sup>2</sup>

(0.56 mW/cm<sup>2</sup>, Max. permissible exposure limit above)

Then MPE Distance is 5.51 cm. (< 30cm)

Test results - Complied with requirement.
