1.3. Measurement Uncertainty

The result of a measurement is only an approximation or estimate of the value of a specific quantity.

And thus the measurand is complete only when a statement of uncertainty is given.

KEC quotes Measurement Uncertainty (U) as follows.

Conducted Disturbance at Mains Port (150kHz-30MHz)	+3.1 / -3.7 dB
Conducted Disturbance at Mains Port (9kHz-30MHz)	+3.4 / -4.3 dB

Radiated Disturbance at Frequency Range from 6GHz up to 26.5GHz 3m method	+4.5 / -5.0 dB
Peak Conducted Output Power Measurement	+1.0 / -1.0 dB
Harmonics Currents Emissions	+/- 6.5 %
Voltage Change, Voltage Fluctuations and Flicker	+/- 2.3 %

Expiration Date : 2015/9/30

The above values are calculated as Expanded Uncertainty (k=2 [95%]).

[Note]

If the measured result is below the specification limit and a margin is less than the above measurement uncertainty, it is impossible to determine compliance at a level of confidence of 95%. However, the measured result indicates high probability that the tested device complies with the specification limit.

[Calculation method]

Maximum Field Strength (dBμV/m)
= Meter Reading (at maximum level of Horizontal or Vertical) (dBμV) + Antenna Factor (dB/m) – Distance factor (*) + Duty Cycle factor (dB) (**)

(*) Applied for Radiated Emission Measurement (above 10GHz) only.
Distance factor : $20 \times \log_{10} (3\text{m}/1\text{m}) = 9.5\text{dB}$

(**) See page 28.

APPENDIX A (DECLARATION OF COMPLIANCE TO MAXIMUM PERMISSIBLE EXPOSURE LIMITS FOR HUMANS)

The Model SRX-SZKFULL with 2400-2483.5MHz DTS transmitter complies with Maximum permissible exposure limits for humans as called out in §1.1310. It is exempt from Maximum Permissible Exposure based on its operating frequency, and power density $0.01\text{mW}/\text{cm}^2$.

Calculation formula :

$$S = PG / 4\pi D^2$$

S : power density (W/m^2)

P : peak output power (W)

G : antenna gain (isotropic)

D : measurement distance (m)

Where :

P = 15.06dBm (see 17 page)

G = 2.14dBi

D = 0.2m

Therefore :

$$S(\text{W} / \text{m}^2) = \frac{10^{\frac{15.06}{10}} \times 10^{-3} \times 10^{\frac{2.14}{10}}}{4 \times \pi \times 0.2 \times 0.2} = 0.1044$$

$$S \doteq 0.01 (\text{mW}/\text{cm}^2)$$

This would be less than $1\text{mW}/\text{cm}^2$ when the separation distance between the user and the device's radiating element is less than 20cm.
