5. MEASUREMENT RESULTS

5.1 Radiated output power

5.1.1 Standard Applicable

[FCC §22.913 Effective radiated power limits]

The effective radiated power(ERP)of transmitters in the Cellular Radiotelephone Service must not exceed the limits in this section.

(2) The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7Watts.

[FCC §24.232 Power and antenna height limits]

(c)Mobile and portable stations are limited to 2 watts EIRP and the equipment must employ a means for limiting power to the minimum necessary for successful communications.

5.1.2 Test Environment conditions

- Ambient temperature : (21 - 22) °C
- Relative Humidity : (56 - 62) % R.H.

5.1.3 Measurement Procedure

[Test configuration and Method; ANSI/TIA/EIA603Clause2.2.17,KDB971168D01&KDB412172D01]

The average radiated power of a licensed device is the equivalent power required. When delivered to a half-wave dipole antenna, to produce at a distant point the same average received power as produced by the licensed device. The other method, procedure and configuration of measurement performed in accordance with above Standard and Guidance.

※ $EIRP(\text{or } ERP) = P_R + L_p$

where;

- $EIRP$ = equivalent (or effective) isotropically radiated power (in same units as P_R)
- P_R = adjusted received power level, in dBm
- L_p = basic free space propagation path loss, in dB (basic free space is KOSTEC test site propagation path loss)

5.2 Out of band radiated

5.2.1 Standard Applicable [FCC §22.917 Emission limitation for cellular equipment]

The rules in this section govern the spectral characteristic of emissions in the Cellular Radiotelephone Service.

(a) *Out of band emissions.* The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43+10\log(P)$ dB

[FCC §24.238 Emission limitation for Broadband PCS equipment]

The rules in this section govern the spectral characteristic of emissions in the Broadband Personal Communications Service.

(a) *Out of band emissions.* The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43+10\log(P)$ dB

5.2.3 Test Environment conditions

5.2.4 Measurement Procedure

[Test configuration and Method; ANSI/TIA/EIA603Clause3.2.12,KDB971168D01&KDB412172D01]

Radiated spurious emissions are emissions from the equipment when transmitting into a non-radiating load on a frequency or frequencies which are outside an occupied band sufficient to ensure transmission of information of required quality for the class of communications desired. The other method, procedure and configuration of measurement performed in accordance with above Standard and Guidance.

5.1.3 Measurement Procedure

The measurements procedure of the transmitter radiated E-field is as following describe method.

The test is performed in a Shield chamber to determine the accurate frequencies, after maximum emissions level will be checked on a test chamber and measuring distance is 3 m from EUT to test antenna. (The chamber is ensured that comply with at least 6 dB above the ambient noise level)

- ① The EUT was powered ON with continuously operating mode and placed on a 0.8 meter high non-conductive table on the reference ground plane.
- ② The test antenna was used on Horn antenna for above 1 GHz, and if the below 1 GHz, broad-band antenna and it's antenna positioned in both the horizontal and vertical plane was location at EUT during the test for maximized the emission measurement.
- ③ The output of the test antenna will be connected to a measuring receiver, and it is set to tuned over the frequency range according to required standard
- ④ The resolution bandwidth below 30MHz setting on the field strength meter is 9kHz and 30MHz~1GHz is 120kHz and above 1GHz, both Peak and Average level were measured with Spectrum Analyzer, and the RBW is set at 1MHz, VBW is set at 3MHz for Peak measure; RBW is set at 1MHz, VBW is set at 10Hz for Average measure(according ANSI C63.10:2009 clause 4.2.3.2.3 procedure for average measure). Both PK and AV level test, PK detector is used.
- ⑤ The fundamental frequency at which a relevant radiated signal component is detected, the test antenna will be raised and lowered through the specified range of heights in horizontal and vertical polarized orientation, until an maximum signal level is detected on the measuring receiver.
- ⑥ The transmitter is position x, y, z axis on rotating through 360 degrees, until the maximum signal level is detected by the measuring receiver.
- ⑦ The receiver is scanned from requested measuring frequency band and then the maximum meter reading is recorded. The radiated emissions were measured with required standard.

- The measurement results are obtained as described below:

$$\text{Result}(dB \mu V/m) = \text{Reading}(dB \mu V) + \text{Antenna factor}(dB/m) + CL(dB) + \text{other applicable factor}(dB)$$

- According to §15.33 (a)(1), Frequency range of radiated measurement is performed the tenth harmonic.

5.1.4 Measurement Uncertainty

All measurements involve certain levels of uncertainties. The factors contributing to uncertainties are test receiver, Cable loss, Antenna factor calibration, antenna directivity, antenna factor variation with height, antenna phase center variation, Antenna frequency interpolation, measurement distance variation, Site imperfection, mismatch, and system repeatability based on NIS 80,81, The measurement uncertainty level with a 95 % confidence level were apply to Uncertainty of a radiation emissions measurement at Chamber of KOSTEC is ± 6.0 dB

5.1.5 Test Configuration

Radiated emission setup, Above 30 MHz, Below 1 GHz

Radiated emission setup, Above 1 GHz
