## 3. COMPLIANCE STATEMENT AND RESULT SUMMARY

The **SIMOCO SRP9130UW / MACOM P3300 UHF Portable Transceiver** complies with the limits defined in 47CFR 15, 47CFR22, 47 CFR Part 90 and 47 CFR Part 2 when tested in-accordance with the test methods described in 47 CFR Part 2.

<u>CLAUSE</u>	<u>TEST PERFORMED</u>	<u>RESULT</u>
90.203	Certification required	Complies
2.1046	RF power output	Noted
90.205	Power and antenna height limits	Complies
2.1047	Modulation Characteristics	
2.1047(a)	Low pass filter response	Complies
2.1047(b)	Modulation limiting characteristics	Complies
90.211(a)	Modulation characteristics	Complies
2.1049	Occupied bandwidth	Noted
2.202	Bandwidths	Noted
22.357	Emission types	Complies
22.359(a)	Emission masks	Complies
90.207	Types of emissions	Complies
90.209	Bandwidth limitations	Complies
90.210	Emission masks	Complies
2.1051	Spurious emissions at antenna terminals	Complies
2.1053	Field strength of spurious radiation	Complies
2.1055	Frequency stability	Noted
22.355	Frequency tolerance	Complies
90.213	Frequency stability	Complies
90.214	Transient frequency behaviour	Complies
15.109	Radiated emission limits	Complies
15.111	Antenna conducted power measurement	Complies

Test Report No 70520.1

Report date: 25th May 2007

## 4. TEST SAMPLE DESCRIPTION

The sample tested has the following specifications:

### Rated Transmitter Output Power

5.0 Watts (36.9 dBm)

### Transmitter frequency range

440-520 MHz

### Test frequencies

Chl	Frequency MHz	Power Watts	Spacing kHz
1	440.075	5.0	12.5
2	470.075	5.0	12.5
3	511.975	5.0	12.5
4	440.075	5.0	25.0
5	470.075	5.0	25.0
6	511.975	5.0	25.0

### FCC Bands

Part 90: 421- 512 MHz

Part 22: 50-450 MHz 450-512 MHz

### Emission Designators / Modes of operation

11k2F3E – Analogue speech

11k2F1D – 1200 baud FFSK

8k10F1E – C4FM digital speech

16k0F3E – Analogue speech

16k0F1D – 1200 baud FFSK

### Power Supply

Battery DC voltage supply. Typically 7.2 Vdc

## 6. ATTESTATION

The **SIMOCO SRP9130UW/ MACOM P3300 UHF Portable Transceiver** complies with the Code of Federal Regulations (CFR) 47 Part 90 –Private Land Mobile Services , Part 22 – Public Land Mobile Services and 47 Part 15 – Radio Frequency Devices.

This report describes the tests and measurements performed for the purpose of determining compliance with the specification with the following conditions:

**The client selected the test sample.**

**The report relates only to the sample tested.**

**This report does not contain corrections or erasures.**

Measurement uncertainties with statistical confidence intervals of 95% are shown below test results. Both Class A and Class B uncertainties have been accounted for, as well as influence uncertainties where appropriate.

In addition this equipment has been tested in accordance with the requirements contained in the appropriate Commission regulations.

To the best of my knowledge, these tests were performed using measurement procedures that are consistent with industry or Commission standards and demonstrate that the equipment complies with the appropriate standards.

I further certify that the necessary measurements were made by EMC Technologies NZ Ltd, 47 MacKelvie Street, Grey Lynn, Auckland, New Zealand.

Andrew Cutler  
General Manager  
EMC Technologies NZ Ltd

## 7. TEST RESULTS

### Certification required

Certification of this device is sought for analogue speech, digital speech and data transmissions using 12.5 kHz and 25.0 kHz channel spacing.

25 kHz and 12.5 kHz channel bandwidth certification is sought for this transmitter under section 90.203(j)(3) as:

- certification has been sought after February 14, 1997 and before January 1, 2011.
- the equipment meets the spectrum efficiency standard of one voice channel per 12.5 kHz of channel bandwidth
- the equipment can operate with a data rate greater than 4.8 kbps per 6.25 kHz

**Result:** Complies.

Test Report No 70520.1

Report date: 25th May 2007

## RF power output

Measurements were carried out at the RF output terminals of the transmitter using a 30 dB power attenuator and a 50  $\Omega$  dummy load.

Measurements were carried out when the transmitter was not being modulated.

Measurements were made with the input voltage set to 7.2 Vdc and when decreased by 10%.

Testing was carried out at maximum power output.

Frequency	Voltage (Vdc)	Rated (dBm)	Measured (dBm)
440.075	7.2	36.9	36.5
470.075	7.2	36.9	36.4
511.975	7.2	36.9	36.4

Frequency	Voltage (Vdc)	Rated (dBm)	Measured (dBm)
470.075	6.48	36.9	36.1
470.075	7.2	36.9	36.4

### *Limits:*

Clause 90.205(h) of Part 90 specifies that in the band 450 – 470 MHz the maximum allowable station effective radiated power (ERP) is dependent upon the station's antenna HAAT and the required service area.

Clause 90.205(i) of Part 90 specifies that in the band 470- 512 MHz the maximum allowable station effective radiated power (ERP) is specified in Clause 90.307 and 90.309.

Part 22 does not specify the transmitter output power.

**Result:** Complies

***Measurement Uncertainty:  $\pm 0.5$  dB***

Test Report No 70520.1

Report date: 25th May 2007

## Modulation Characteristics

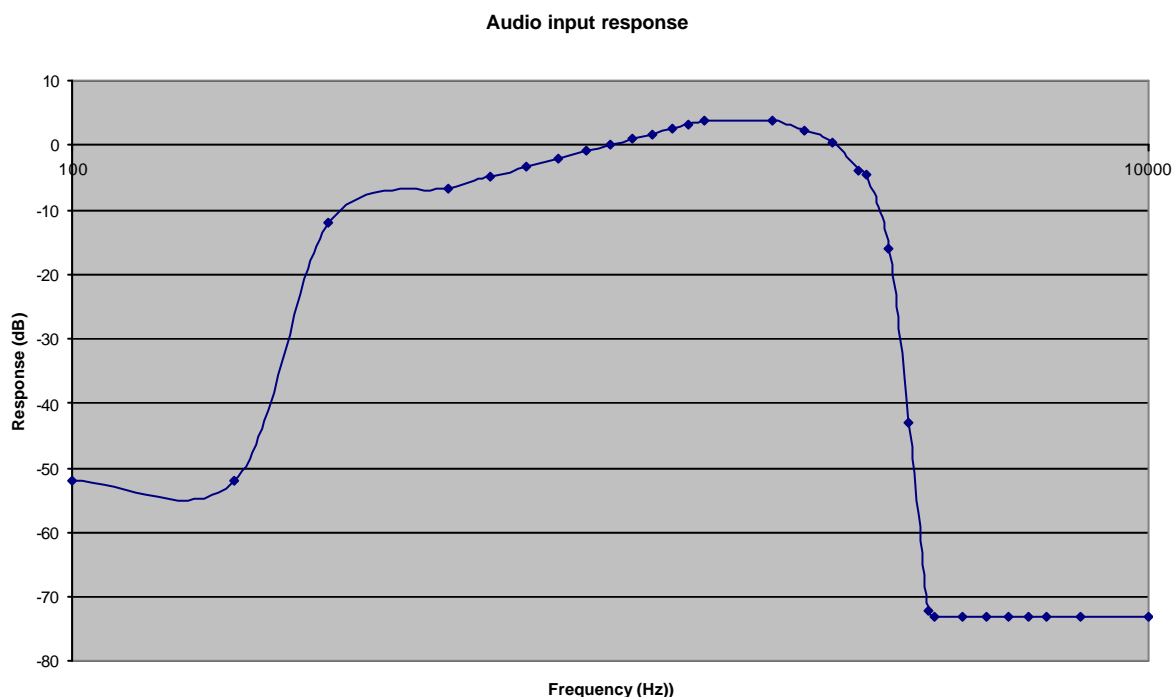

This transmitter is capable of producing analogue speech and digital speech modulations.

(a) Frequency response of the audio frequency low pass filter between 100 Hz and 15 kHz.

This measurement was carried out using an audio signal generator and an audio modulation analyser.

At 1 kHz an audio signal was applied which was used as a 0 dB response reference.

The frequency of the input signal was then varied and the output response noted. This measurement was carried out from 100 Hz to 5000 Hz as required by Part 2 with further measurements carried out in order to show the full range of this filter.

# EMC Technologies (NZ) Ltd

Test Report No 70520.1

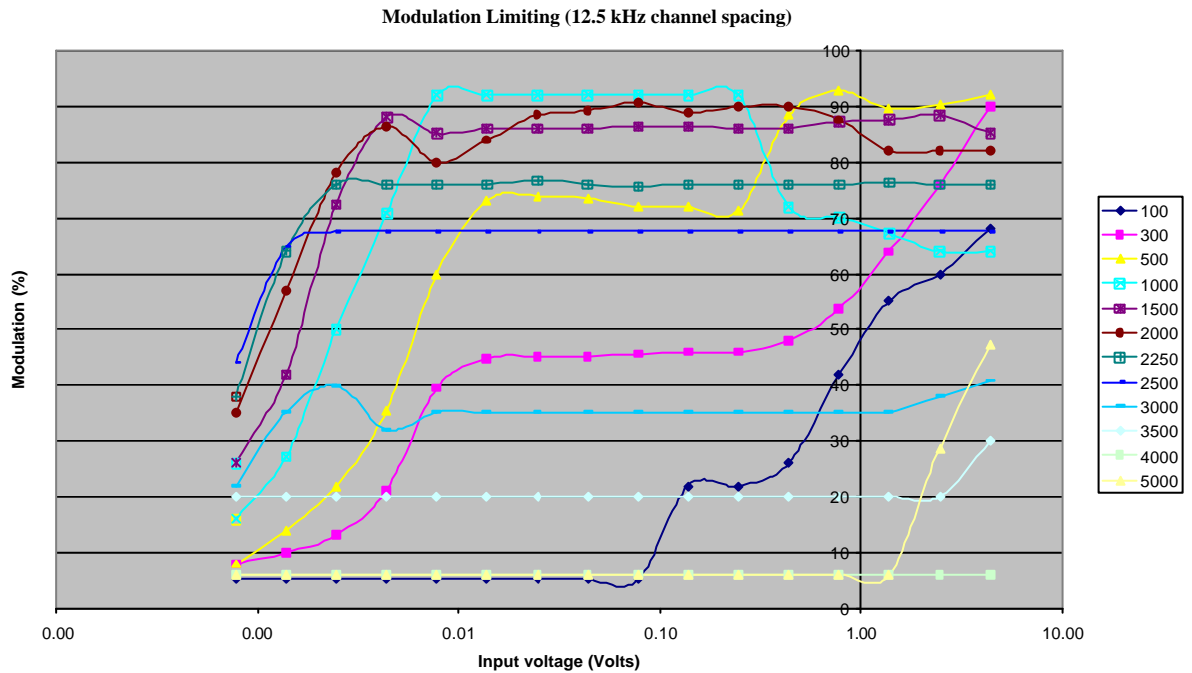

Report date: 25th May 2007

(b) A family of curves showing the percentage of modulation versus the modulation input voltage.

Measurements were made between 100 Hz to 4 kHz.

At each frequency the input voltage was slowly increased with the resulting frequency deviation of the transmitter being recorded.

This deviation was then converted to a modulation percentage where 5 kHz deviation is 100% for 25 kHz channels and 2.5 kHz deviation is 100% for 12.5 kHz channels.

# EMC Technologies (NZ) Ltd

Test Report No 70520.1

Report date: 25th May 2007

Modulation limiting (25 kHz channel spacing transmitter)

(d) A curve or equivalent data that shows that the equipment will meet the modulation requirements of the rules under which the equipment is to be licensed.

Digital modulation as detailed below is also used with this transmitter.

The types of modulation used are:

C4FM digital modulation is used for digital telephony (F1E).

1200 baud FFSK data is used for data transmissions (F1D).

### *Limit:*

Part 90.211 – Modulation requirements states the transmitter must meet the emission requirements of 90.210. Refer to the Occupied Bandwidth measurements in this report.

**Result:** Complies

***Measurement Uncertainty:***  $\pm 1\%$ .

## **Part 90.207 – Emission types:**

The following emission types are used:

- F3E: Frequency modulation with analogue speech.
- F1E: Digital telephony using C4FM.
- F1D: Data transmission using 1200 baud FFSK data.

## **Part 90.209 – Bandwidth limitations:**

The authorised bandwidth is taken to be the necessary bandwidth.

Using the formulas contained in Part 2.202 the necessary bandwidth calculation for the 25 kHz channel step emission is:

$$B_n = 2 \times D + 2 \times M$$

Where D = maximum deviation: 5.0 kHz

Where M = maximum modulation frequency: 3 kHz

$$B_n = \underline{16 \text{ kHz}}$$

This is confirmed in the emission designation, 16k0F3E, declared by the client.

Using the formulas contained in Part 2.202 the necessary bandwidth calculation for the 12.5 kHz channel step emission is:

$$B_n = 2 \times D + 2 \times M$$

Where D = maximum deviation: 2.5 kHz

Where M = maximum modulation frequency: 3 kHz

$$B_n = \underline{11 \text{ kHz}}$$

This is confirmed in the emission designation, 11k0F3E, declared by the client.

---

E-mail: aucklab@ihug.co.nz

# EMC Technologies (NZ) Ltd

Test Report No 70520.1

Report date: 25th May 2007

---

## **Part 22.359 – Bandwidth limitations:**

Part 22.359(a) – Analog modulation. No authorised bandwidth is defined so the necessary bandwidth is taken to be the authorised bandwidth.

Using the formulas contained in Part 2.202:

$$B_n = 2 \times D + 2 \times M$$

Where D = maximum deviation: 2.5 kHz or 5.0 kHz

Where M = maximum modulation frequency: 3 kHz

$$B_n = \underline{11.0 \text{ kHz or } 16 \text{ kHz}}$$

This is confirmed in the emission designations, 11k0F3E and 16k0F3E as declared by the client.

This transmitter can also transmit digital telephony and data using F1E and F1D.

Using the tables in Part 2.202 – Bandwidth, bandwidths for the F1D and F1E emissions could not be determined easily.

Therefore the occupied bandwidth has been measured and compared against the occupied bandwidth declared by the client.

Measurements have been made of each modulation type using a spectrum analyser operating in peak hold mode and a 30 dB attenuator.

Initially power measurements are made using a resolution bandwidth of 120 kHz which is used as a reference level on the spectrum analyser.

The resolution bandwidth is then changed to 100 Hz and the reference level minus 23 dB (99%) absolute bandwidth points determined

However in keeping with the method used previously the F1D bandwidths have been measured relative to the 100 Hz bandwidth maximum.

The F1E bandwidth has been measured using the above described method.

Emission	Channel	Measured	Designation
F1D	12.5 kHz	7.3 kHz	11k0F1D
F1E	12.5 kHz	7.5 kHz	8k10F1E
F1D	25.0 kHz	11.3kHz	16k0F1D

## **Occupied Bandwidth**

The spectrum masks are defined in:

Section 90.210(d) – Masks B and D have been applied as the transmitter can operate in the band 421-512 MHz using an authorised bandwidth of 20.0 kHz and 11.25 kHz as per Section 90.209(b)(5).

The reference level for the following emission mask measurements has been determined using a resolution bandwidth of 120 kHz with the transmitter modulated.

All measurements have been made with a 30 dB attenuator being placed between the transmitter and the spectrum analyser.

Measurements were made in peak hold with the transmitter operating on 470.075 MHz.

When operating in F3E mode a 2500 Hz tone, which was found to be the frequency of maximum response, that was applied at a level 16 dB higher than that required to achieve 50% modulation.

For the F1E and F1D modes the transmitter was modulated uses modulation sources internal to the transmitter as supplied by the client.

Section 22.359(a) has been applied when analogue speech is utilised. The authorised bandwidth is taken as the necessary bandwidth which has been determined by calculation.

The 12.5 kHz transmitter has an authorised bandwidth (necessary bandwidth calculated) of 11 kHz applied and the 25 kHz transmitter has an authorised bandwidth of 16 kHz applied

Section 22.359(b) (1) has been applied when F1D and F1E are utilised. Authorised bandwidths of 7.3, 7.5 and 11.3 kHz (based upon the measured occupied bandwidths) have been applied.

**Result:** Complies

## Transmitter spurious emissions at the antenna terminals

**Frequency:** 470.075 MHz

Spurious emission (MHz)	Emission level (dBm)	Limit (dBm)
940.150	-55.5	-20.0
1410.225	-44.8	-20.0

No other emissions observed above -60.0dBm.

### *Limit:*

Part 90.210(d) Mask D, (3) on any frequency removed from the centre of the authorised bandwidth by a displacement frequency of more than 12.5 kHz shall be attenuated by at least  $50 + 10 \log (P)$  or 70 dB whichever is the lesser attenuation.

The spurious emission limit defined by Mask D has been applied as this transmitter can operate using channel spacings of 12.5 kHz.

Part 2.1051 states that emissions greater than 20 dB below the limit need not be specified.

Part 2.1057 states that the spectrum should be investigated up to the 10<sup>th</sup> harmonic if the transmitter operates below 10 GHz.

A rated power of 5.0 watts gives a limit of -20 dBm.

Some emissions less than -40 dBm have been reported for completeness.

No measurements were made above the 10<sup>th</sup> harmonic.

**Result:** Complies

**Measurement Uncertainty:**  $\pm 3.3$  dB

425.075	-91.0	-57.0

Receive frequency: 511.975 MHz

Intermediate frequency: 45.000 MHz

Spurious emission (MHz)	Emission level (dBm)	Limit (dBm)
466.975	-86.2	-57.0
2334.875	-86.0	-57.0
2801.850	-84.0	-57.0

All other emissions observed less than -90.0 dBm.

### *Limit:*

In accordance with CFR 47 Part 15, section 15.111 the power of any emission at the antenna terminal should not exceed 2 nW (-57.0 dBm).

**Result:** Complies

**Measurement Uncertainty:** ±3.3 dB

Test Report No 70520.1

Report date: 25th May 2007

## Field strength of the transmitter spurious emissions

Frequency: 470.075 MHz

Transmit emissions

Frequency (MHz)	Level (dBuV/m)	Power (dBm)	Limit (dBm)	Polarity	Margin (dB)
940.1500	45.1	-52.3	-20.0	Vertical	32.3
940.1500	43.5	-51.7	-20.0	Horizontal	31.7
1410.2250	47.9	-47.3	-20.0	Vertical	27.3
1410.2250	47.5	-47.7	-20.0	Horizontal	27.7
1880.3000	44.4	-50.8	-20.0	Vertical	30.8
1880.3000	47.9	-47.3	-20.0	Horizontal	27.3
2350.3750	51.1	-44.1	-20.0	Vertical	24.1
2350.3750	51.8	-43.4	-20.0	Horizontal	23.4
2820.4500	36.8	-58.4	-20.0	Vertical	38.4
2820.4500	39.6	-55.6	-20.0	Horizontal	35.6
3290.5250	35.7	-59.5	-20.0	Vertical	39.5
3290.5250	43.1	-52.1	-20.0	Horizontal	32.1
3760.6000	36.1	-59.1	-20.0	Vertical	39.1

When operating in transmit mode no significant emissions were detected between the harmonic emissions that were detected.

Device was tested on an open area test site at a distance of 3 metres.

The transmitter was tested while transmitting continuously while attached to a dummy load.

### *Limit:*

All spurious emissions are to be attenuated by at least  $50 + 10 \log (P)$ .

The rated power of 5 watts gives a limit of  $-20$  dBm.

No measurements were made above the 10<sup>th</sup> harmonic.

**Result:** Complies

**Measurement Uncertainty:**  $\pm 4.1$  dB

Test Report No 70520.1

Report date: 25th May 2007

## Field strength of the receiver spurious emissions

**Frequencies:** 440.075 MHz, 470.075 MHz, 511.975 MHz

**Intermediate frequency:** 45.000 MHz

440.075 MHz

Frequency (MHz)	Vert (dBuV/m)	Hort (dBuV/m)	Limit	Margin (dB)
425.0750	36.8	31.5	46.0	9.2

470.075 MHz

Frequency (MHz)	Vert (dBuV/m)	Hort (dBuV/m)	Limit	Margin (dB)
395.0750	31.5	31.1	46.0	14.5

511.975 MHz

Frequency (MHz)	Vert (dBuV/m)	Hort (dBuV/m)	Limit	Margin (dB)
466.9750	42.4	38.5	46.0	3.5

Device was tested on an open area test site at a distance of 3 metres.

Below 1000 MHz a quasi peak detector was used with a bandwidth of 120 kHz.

Above 1000 MHz an average detector was used with a bandwidth of 1 MHz.

The receiver was tested while receiving continuously while attached to a dummy load.

### *Limit:*

The field strength limits as per CFR 47 Part 15, section 15.109 have been applied.

**Result:** Complies

Test Report No 70520.1

Report date: 25th May 2007

## Frequency Stability

Frequency stability measurements were between - 30 °C and + 50°C in 10°C increments.

At each temperature the transmitter was given a period of 30 minutes to stabilise. The transmitter was then turned on and the frequency error measured after a period of 1 minute.

Measurements were made with the supply decreased 10% from nominal battery voltage supply.

A reduction of 15% could not be achieved due to the type of battery normally used.

Nominal Frequency: 470.075 MHz

Temp.	6.4 Vdc	7.2 Vdc
+50° C	-391.0	-391.0
+40° C	-339.0	-347.0
+30° C	-291.0	-289.0
+20° C	-289.0	-287.0
+10° C	+17.0	+21.0
0° C	-38.0	-35.0
-10° C	-9.0	-7.0
-20° C	+31.0	+33.0
-30° C	-264.0	-229.0

### *Limit:*

Part 22.355 and Part 90.213 state that mobile station transmitters operating between 421 – 512 MHz with 12.5 kHz channelling are required to have a frequency tolerance of 2.5 ppm.

This transmitter operates on 470.0750 MHz.  $2.5 \text{ ppm} = 2.5 \times 470 = 1175 \text{ Hz}$ .

**Result:** Complies

**Measurement Uncertainty:**  $\pm 30 \text{ Hz}$

# EMC Technologies (NZ) Ltd

Test Report No 70520.1

Report date: 25th May 2007

## Transient frequency behaviour

Transient frequency behaviour measurements are applicable to wide band and narrow band transmitters operating in the frequency band 421-512 MHz. Measurements were carried out at 470.075 MHz using the method described in TIA-603 and EN 300-086. In summary this method calls for the use of an external signal generator tuned to 470.075 MHz with a output level 0.1 % (-30 dB) of the level from the transmitter with a 1 kHz tone with a frequency deviation of 12.5 kHz being applied to the input of a modulation analyser along with the output from the transmitter.

The modulation analyser produces an amplitude difference signal and a frequency difference signal, which are applied to the input of a storage oscilloscope.

The unmodulated transmitter is then keyed which produces a trigger pulse that is AC coupled to the oscilloscope that produces a display on the screen.

The result of the change in the ratio of power between the test signal from the signal generator and the transmitter output will produce 2 separate sides on the oscilloscope picture. One will show the 1000 Hz test modulation and the other will be the frequency difference of the transmitter versus time.

Measured Transient Deviation		
Period $t_1$ (ms)	period $t_2$ (ms)	period $t_3$ (ms)
10.0	25.0	10.0
Frequency Difference from the Nominal Frequency (kHz)		
Nil	Nil	Nil
Nil	Nil	Nil

### *Limits:*

Channel Spacing (kHz)	Transmitter Period $t_1$ (kHz)	Transmitter Period $t_2$ (kHz)	Transmitter Period $t_3$ (kHz)
12.5	$\pm 12.5$	$\pm 6.25$	$\pm 12.5$
25.0	$\pm 25.0$	$\pm 12.5$	$\pm 25.0$

**Result:** Complies

**Measurement Uncertainty:** Frequency difference  $\pm 1.6$  kHz  
Time period  $\pm 1$  ms

Test Report No 70520.1

Report date: 25th May 2007

## 12.5 kHz transmitter turn on

Green Trace = 1 kHz tone with FM deviation of 12.5 kHz and any transient.

Green trace has been maximised to give full screen indication of a  $\pm 12.5$  kHz.

Therefore each Y axis division = 3.125 kHz per division.

The X axis has been set to a sweep rate of 10 mS/division.

Triggering has been set to occur 2 divisions from the left hand edge (20 mS).

This is position  $t_{on}$ .

$t_1$  occurs between 2.0 and 3.0 divisions from the left-hand edge.

$t_2$  occurs between 3.0 and 5.5 divisions from the left-hand edge.

No transient can be observed just after  $t_{on}$ .

## 12.5 kHz transmitter turn off

Green Trace = 1 kHz tone with FM deviation of 12.5 kHz and any transient.

Green trace has been maximised to give full screen indication of a  $\pm 12.5$  kHz.

Therefore each Y axis division = 3.125 kHz per division.

The X axis has been set to a sweep rate of 10 mS/division.

The display of the 1 kHz signal rising has been positioned 5 divisions from the left hand edge (50 mS).

This is position *toff*.

*t3* occurs between 4.0 and 5.0 divisions from the left hand edge.

A small transient response can be observed just before *toff*.
