

Theory instruction:

1. Using the infrared remote controller closes to the access controller (RD-004), enter the correct program code, then it will have the light and the sounds to inform you the entry of into the program mode,
2. Setting the access controller (RD-004) as the mode of issuing cards, put the card closed to the access controller, read the card's data by the mode of reading cards, and also will keep in the storage of the single chip. It will have the lights and sound to inform.
3. If put the cards which is setup closed to the access controller, the reading mode will read the card's data. The data will send to the CPU, and compare with the form storage data, if it is correct, then the relay will action, and open the door.
