(4)	If yes, pls explain how it was implemented:  Neet 15.202 requirement Yes No pls check below:  A master device is defined as a device operating in a mode in which it has the capability to transmit without receiving an enabling signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other devices  A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the master. A device in client mode is not able to initiate a network.								
(5) For client devices that have software configuration control to operate in different modes (ac scanning in some and passive scanning in others) in different bands (devices with multiple equipment classes or those that operate on non-DFS frequencies) or modular devices whice configure the modes of operations through software, the application must provide software operations description on how the software and / or hardware is implemented to ensure the proper operations modes cannot be modified by end user or an installer.  Apply  Does not apply  (If apply, pls help to provide explanation on it was implement, and how software was control									nd
	Should you have any questions or comments regarding this matter, please have my best attention.
