F = frequency in MHz, * Plane-wave equivalent power density

Friis transmission formula: Pd=(Pout*G)\(4*π*R²)

Where

reached.

Pd= Power density in mW/cm² Pout=output power to antenna in Mw G= gain of antenna in linear scale π =3.1416 R= distance between observation point and center of the radiator in cm Pd the limit of MPE, 1mW/cm2. If we know the maximum gain of the antenna and total power input to the antenna, through the calculation, we will know the distance where the MPE limit is

Measurement Result

From the peak EUT RF output power, the minimum mobile separation distance, d=0.2m, as well as the gain of the antenna is -0.68dBi, the RF power density can be obtained.

The measurement results comply with the FCC Limit per 47 CFR 2.1091 for the uncontrolled RF Exposure.

FCC Radiation Exposure Statement

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. In order to avoid the possibility of exceeding the FCC radio frequency exposure limits, Human proximity to the antenna shall not be less than 20cm(8 inches) during normal operation. Proposed RF exposure safety information to include in User's Manual.
