Prediction of MPE at a given distance

1. Limits

The criteria listed in the following table shall be used to evaluate the environment impact of human exposure to radio frequency (RF) radiation as specified in 1.1307(b)

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)								
(A) Limits for Occupational/Controlled Exposure												
0.3-3.0	614	1.63	*100	6								
3.0-30	1842/f	4.89/f	*900/f ²	6								
30-300	61.4	0.163	1.0	6								
300-1,500			f/300	6								
1,500-100,000			5	6								
	(B) Limits for Gener	al Population/Uncontrolled	Exposure									
0.3-1.34	614	1.63	*100	30								
1.34-30	824/f	2.19/f	*180/f ²	30								
30-300	27.5	0.073	0.2	30								
300-1,500			f/1500	30								
1,500-100,000			1.0	30								

2. Test Procedure

Equation from page 18 of OET Bulletin 65, Edition 97-01

$$S = \frac{P \times G}{4 \times \pi \times R^2}$$

Where:

S = power density

P = power input to the antenna

G = numeric gain of the antenna in the direction of interest relative to an isotropic radiator

R = distance to the centre of radiation of the antenna

3. Result

Worse case is as below:

Ī	Mode	Frequency (MHz)	Prediction distance (cm)	RF output power		MPE	Limit	SAR Test
				dBm	mW	(mW/cm ²)	(mW/cm ²)	Exclusion
	WIFI	2412-2462	20	19.59	90.9913	0.0361	1	Yes

ANT1: Internal Antenna, max gain 3dBi. dBi to Numeric(2) ANT2: Internal Antenna, max gain 3dBi. dBi to Numeric(2)

Conclusion: Pass.
