## GENERAL INFORMATION

---

### Product Description for Equipment under Test (EUT)

The *RTX Hong Kong Ltd.*'s product, model number: *RTX4088 Handset (FCC ID: T7HCT4088)* in this report is a *UPCS Handset*, which was measured approximately: 13.4 cm (L) \* 4.1 cm (W) \* 2.5 cm (H), rated with input voltage: DC3.7V battery.

*\* All measurement and test data in this report was gathered from production sample serial number: 170320005 (Assigned by BAACL, Kunshan). The EUT supplied by the applicant was received on 2017-03-20.*

### Objective

This test report was based on the Electromagnetic Interference (EMI) tests performed on the EUT. The EMI measurements were performed according to the measurement procedure described in ANSI C63.17 - 2013.

The tests were performed in order to determine the compliance of the EUT with FCC Part 15-Subpart D, section 15.203, 15.315, 15.317, 15.319 and 15.323 rules.

This is a CIIPC application of the device; the differences between the original device and the current one are as follows:

1. Updated the test standard

For the change made to the device, the test item "Specific Requirements for UPCS" were performed.

### Related Submittal(s)/Grant(s)

No related submittal(s).

### Test Methodology

All measurements contained in this report were conducted with ANSI C63.17-2013, American National Standard Methods of Measurement of the Electromagnetic and Operational Compatibility of Unlicensed Personal Communications Services (UPCS) Devices.

All emissions measurement was performed at Bay Area Compliance Laboratories Corp. (Kunshan). The radiated testing was performed at an antenna-to-EUT distance of 3 meters.

### Measurement Uncertainty

Item		Uncertainty
AC Power Lines Conducted Emissions		±3.26 dB
RF conducted test with spectrum		±0.9dB
RF Output Power with Power meter		±0.5dB
Radiated emission	30MHz~1GHz	±5.91dB
	Above 1G	±4.92dB
Occupied Bandwidth		±0.5kHz
Temperature		±1.0°C
Humidity		±6%

### Test Facility

The test site used by Bay Area Compliance Laboratories Corp. (Kunshan) to collect test data is located on the No.248 Chenghu Road, Kunshan, Jiangsu province, China.

Test site at Bay Area Compliance Laboratories Corp. (Kunshan) has been fully described in reports submitted to the Federal Communication Commission (FCC). The details of these reports have been found to be in compliance with the requirements of Section 2.948 of the FCC Rules on November 06, 2014. The facility also complies with the radiated and AC line conducted test site criteria set forth in ANSI C63.17-2013.

The Federal Communications Commission has the reports on file and is listed under FCC Registration No.: 815570. The test site has been approved by the FCC for public use and is listed in the FCC Public Access Link (PAL) database.

## **SYSTEM TEST CONFIGURATION**

---

### **Description of Test Configuration**

The system was configured for testing in TBR6 mode which is provided by the manufacturer.

### **Equipment Modifications**

No modification was made to the EUT tested.

### **Block Diagram of Test Setup**

## SUMMARY OF TEST RESULTS

FCC Rules	Description of Test	Result
§ 1.1307, §2.1093	RF Exposure (SAR)	Compliance
§ 15.317 § 15.203	Antenna Requirement	Compliance
§ 15.315 § 15.207	Conducted Emission	Compliance*
§ 15.323 (a)	Emission Bandwidth	Compliance*
§ 15.319 (c)	Peak Transmit Power	Compliance*
§ 15.319 (d)	Power Spectral Density	Compliance*
§ 15.323 (d)	Emission Inside and Outside the sub-band	Compliance*
§ 15.319 (g)	Radiated Emission	Not Applicable
§ 15.323 (f)	Frequency Stability Handset	Compliance*
§ 15.323 (c)(e) § 15.319 (f)	Specific Requirements for UPCS	Compliance

Compliance\*: Please referred to the original report 187284-12 with the FCC: T7HCT4088, which was tested by Nemko AS.

**TEST EQUIPMENT LIST**

Manufacturer	Description	Model	Serial Number	Calibration Date	Calibration Due Date
<b>RF Conducted test</b>					
BACL	TS 8997 Cable-01	T-KS-EMC086	T-KS-EMC086	2016-12-09	2017-12-08
BACL	RF cable	KS-LAB-012	KS-LAB-012	2016-12-15	2017-12-14
WEINSCHTEL	3dB Attenuator	5326	N/A	2016-06-18	2017-06-18
Rohde & Schwarz	Signal Analyzer	FSIQ26	836131/009	2016-09-21	2017-09-21
Rohde & Schwarz	Digital radicommunication tester	CMD60	830553/018	2016-09-21	2017-09-21
HONOVA	Power Splitter	ZFRSC-14-S+	019411452	2016-06-12	2017-06-12

\* **Statement of Traceability:** Bay Area Compliance Laboratories Corp. (Kunshan) attests that all calibrations have been performed in accordance to requirements that traceable to National Primary Standards and International System of Units (SI).

---

## **FCC §1.1307 & §2.1093 - RF EXPOSURE**

---

### **Applicable Standard**

FCC§1.1307 and §2.1093.

### **Test Result**

Compliance, please refer to the SAR report: D-PL-121309-01-01.

---

## **FCC§15.317&§15.203 - ANTENNA REQUIREMENT**

---

### **Applicable Standard**

According to FCC § 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this Section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

### **Antenna Connector Construction**

The EUT has one integrated antenna arrangement, which was permanently attached and the gain was 1 dBi, fulfill the requirement of this section. Please refer to the internal photos.

## FCC§15.323 (c) (e) & §15.319(f) – SPECIFIC REQUIREMENTS FOR UPCS DEVICE

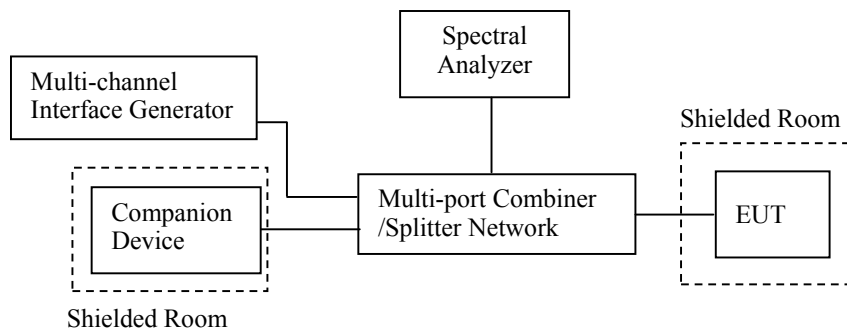

### Applicable Standard

FCC§15.323(c)(e) & §15.319(f) Specific Requirements for UPCS device.  
ANSI C63.17 2013 §6.2 Frequency and time stability and §7.Monitoring tests and §8.Time and spectrum window access procedure.

### Test Procedure

Measurement method according to ANSI C63.17- 2013

Test configuration as below

### Test Data

#### Environmental Conditions

Temperature:	26 °C
Relative Humidity:	53%
ATM Pressure:	100.0 kPa

The testing was performed by Echo Wu on 2017-04-10.

**Test Result:** Compliance, please see the below data

#### 1) Automatic Discontinuation of Transmission, FCC §15.319(f)

The device shall automatically discontinue transmission in case of either absence of information to transmit or operational failure. The provisions in this section are not intended to preclude transmission of control and signaling information or use of repetitive codes used by certain digital technologies to complete frame or burst intervals.

**Test result:**

The following tests were performed after a connection had been established with handset.

Test condition	Reaction of EUT	Pass/Fail
Adapter removed from EUT	Connection break down	Pass
The Handset power off	Connection break down	Pass

**2) Monitoring Time, FCC §15.323(c) (1)**

Immediately prior to initiating transmission, devices must monitor the combined time and spectrum window in which they intend to transmit. For a period of at least 10 milliseconds for systems designed to use a 10 milliseconds or shorter frame period or at least 20 milliseconds for systems designed to use a 20 milliseconds frame period

**Test procedure:**

Measurement method is in according to ANSI C63.17 -2013 clause 7.3.3. RF signal generators apply uniform CW interference on all system carriers except two carriers (designated  $f_1$  and  $f_2$ ), each at level  $T_L + U_M$ . EUT can only transmit on these two carriers.

**Test result:**

This requirement is covered by the results of Least Interfered Channel (LIC).

Interference (Refer to ANSI C63.17 clause 7.3.3)	Reaction of EUT	Results
a) Apply the interference on $f_1$ at level $T_L + U_M + 20\text{dB}$ and no interference on $f_2$ . Initiate transmission and verify the transmission only on $f_2$ . Then terminate it.	EUT transmits on $f_2$	Pass
b) Apply the interference on $f_2$ at level $T_L + U_M + 20\text{dB}$ and immediately remove all interference from $f_1$ . The EUT should immediately attempt transmission on $f_1$ (but at least 20 ms after the interference on $f_2$ is applied), verify the transmission only on $f_1$ .	EUT transmission $f_1$	Pass

**3) Lower Monitoring Threshold, FCC §15.323(c) (2)**

The monitoring threshold must not be more than 30 dB above the thermal noise power for a bandwidth equivalent to the emission bandwidth used by the device.

**Test procedure:**

Measurement method according to ANSI C63.17 -2013 clause 7.3.1

**Test result:**

Not applicable because the EUT has more 40 defined duplex system access channels and meet the provision of the Least Interfered Channel (LIC) based on FCC §15.323(c) (5).

**4) Maximum Transmit Period, FCC §15.323(c) (3)**

If no signal above the threshold level is detected, transmission may commence and continue with the same emission bandwidth in the monitored time and spectrum windows without further monitoring. However, occupation of the same combined time and spectrum windows by a device or group of cooperating devices continuously over a period of time longer than 8 hours is not permitted without repeating the access criteria.

**Test procedure:**

Measurement method according to ANSI C63.17- 2013 clause 8.2.2

The test procedure is as follows:

- a) Activate the EUT and initiate a communication channel with the companion device, and start a timer or frame counter.
- b) The centre frequency of spectrum analyzer was set to the carrier frequency and SPAN was set to ZERO. The spectrum analyzer was used to monitor the time and spectrum window of the communication channel.
- c) Stop the timer at the end of the EUT transmission on the current time and frequency window (measure the time until the EUT changes to a different slot).

**Test result:**

Repetition of Access Criteria	Measured Maximum Transmission Time (Second)	Limit (Second)	Results
First	16490	28,800	Pass
Second	16470	28,800	Pass

**5) System Acknowledgement, FCC §15.323(c) (4)**

Once access to specific combined time and spectrum windows is obtained an acknowledgment from a system participant must be received by the initiating transmitter within one second or transmission must cease.

Periodic acknowledgments must be received at least every 30 seconds or transmission must cease. Channels used exclusively for control and signaling information may transmit continuously for 30 seconds without receiving an acknowledgment, at which time the access criteria must be repeated.

**Test procedure:**

Measurement method according to ANSI C63.17 -2013 clause 8.2.1

During testing initial transmission without acknowledgement, the signal from the EUT to the companion device is blocked by the circulator.

The test of the transmission time after loss of acknowledgements is performed by cutting off the signal from the companion device by a RF switch and measuring the time until the EUT stops transmitting.

**Test result:**

Test	Time taken(second)	Limit (second)	Result
Initial Connection acknowledgement	0.06	1	Pass
Change of access criteria for control information	N/A	30	N/A
Transmission cease time after loss of acknowledgement	5.58	30	Pass

Note: N/A=Not Applicable

**6) Least Interfered Channel (LIC), FCC §15.323(c) (5)**

If access to spectrum is not available as determined by the above, and a minimum of 20 duplex system access channels are defined for the system, the time and spectrum windows with the lowest power level may be accessed.

A device utilizing the provisions of this paragraph (5) must have monitored all access channels defined for its system within the last 10 seconds and must verify, within the 20 milliseconds (40 milliseconds for devices designed to use a 20 millisecond frame period) immediately preceding actual channel access, that the detected power of the selected time and spectrum windows is no higher than the previously detected value.

The power measurement resolution bandwidth for this comparison must be accurate to within 6 dB. No device or group of cooperating devices located within 1 metre of each other shall during any frame period occupy more than 6 MHz of aggregate bandwidth, or alternatively, more than one third of the time and spectrum windows defined by the system.

Calculation of monitoring threshold limits for isochroous devices:

Lower threshold:  $T_L = -174 + 10 \log_{10} B + M_L + P_{MAX} - P_{EUT}$  (dBm)

Where: B=Emission bandwidth (Hz)

$M_L$  =dB the threshold may exceed thermal noise (30 for  $T_L$ )

$P_{MAX} = 5 \log_{10} B - 10$  (dBm)

$P_{EUT}$  =Transmitted power (dBm)

**Calculated thresholds:**

Monitor Threshold	B(MHz)	$M_L$ (dB)	$P_{MAX}$ (dBm)	$P_{EUT}$ (dBm)	Threshold (dBm)
Lower threshold	1.4423	30	20.80	22.50	-84.11

Note: 1. The upper threshold is applicable as the EUT utilizes more than 20 duplex system channels

**Test procedure:**

Measurement method according to ANSI C63.17 clause 7.3.2, 7.3.3

**C63.17 clause 7.3.2, LIC procedure test:**

- a) Allow EUT transmission on only two carrier frequencies, which will be designated  $f_1$  and  $f_2$ .
- b) Apply interference to the EUT on  $f_1$  at a level of  $TL + UM + 7$  dB and on  $f_2$  at a level of  $TL + UM$ . Initiate transmission. The EUT should transmit on  $f_2$ . Terminate the connection. Repeat five times. If the EUT transmits once on  $f_1$ , the test failed.
- c) Apply interference to the EUT on  $f_1$  at a level of  $TL + UM$  and on  $f_2$  at a level of  $TL + UM + 7$  dB. Initiate transmission. The EUT should transmit on  $f_1$ . Terminate the connection. Repeat five times. If the EUT transmits once on  $f_2$ , the test failed.
- d) Apply interference to the EUT on  $f_1$  at a level of  $TL + UM + 1$  dB and on  $f_2$  at a level of  $TL + UM - 6$  dB. Initiate transmission. If the EUT transmits on  $f_2$ , terminate the connection. Repeat five times. If the EUT transmits once on  $f_1$ , the test failed.
- e) Apply interference to the EUT on  $f_1$  at a level of  $TL + UM - 6$  dB and on  $f_2$  at a level of  $TL + UM + 1$  dB. Initiate transmission. If the EUT transmits on  $f_1$ , terminate the connection. Repeat five times. If the EUT transmits once on  $f_2$ , the test failed.

**C63.17 clause 7.3.3, Selected channel confirmation:**

- a) Allow EUT transmission on only two carrier frequencies, which will be designated  $f_1$  and  $f_2$ . This limitation to carriers  $f_1$  and  $f_2$  is performed preferably by administration commands for the EUT, or alternatively by applying by a multicarrier interference generator uniform interference on all system carriers except  $f_1$  and  $f_2$ , at a level of  $TL + UM + 20$  dB in-band per carrier. Set the interference level to the EUT on  $f_1$  to a level of  $TL + UM + 20$ dB, and let there be no interference applied on  $f_2$ .
- b) Initiate transmission and verify that the EUT transmits on  $f_2$ . If a connection was made, terminate it.
- c) Apply interference on  $f_2$  at a level of  $TL + UM + 20$  dB in-band, and immediately remove all interference from  $f_1$  and immediately (but not sooner than 20 ms after the interference on  $f_2$  is applied) cause the EUT to attempt transmission. The EUT should now transmit on  $f_1$ , if it transmits.
- d) If the EUT transmits on  $f_2$ , it fails.

**Test result:**

**1) LIC procedure test:**

Interference (Refer to ANSI C63.17 clause 7.3.3)	Reaction of EUT	Results
a) Apply the interference on $f_1$ at level $T_L+U_M+7\text{dB}$ and the interference on $f_2$ at level $T_L+U_M$ . Initiate transmission and verify the transmission only on $f_2$ . Repeat 5 times.	EUT transmits on $f_2$	Pass
b) Apply the interference on $f_1$ at level $T_L+U_M$ and the interference on $f_2$ at level $T_L+U_M+7\text{dB}$ . Initiate transmission and verify the transmission only on $f_1$ . Repeat 5 times.	EUT transmits on $f_1$	Pass
c) Apply the interference on $f_1$ at level $T_L+U_M+1\text{dB}$ the interference on $f_2$ at level $T_L+U_M-6\text{dB}$ . Initiate transmission and verify the transmission only on $f_2$ . Repeat 5 times.	EUT transmits on $f_2$	Pass
d) Apply the interference on $f_1$ at level $T_L+U_M-6\text{dB}$ and the interference on $f_2$ at level $T_L+U_M+1\text{dB}$ . Initiate transmission and verify the transmission only on $f_1$ . Repeat 5 times.	EUT transmits on $f_1$	Pass

**2) Selected channel confirmation:**

Interference (Refer to ANSI C63.17 clause 7.3.4)	Reaction of EUT	Results
a) Apply the interference on $f_1$ at level $T_U+U_M$ and no interference on $f_2$ . Initiate transmission and verify the transmission only on $f_2$ . Then terminate it.	EUT transmits on $f_2$	Pass
b) Apply the interference on $f_2$ at level $T_L+U_M$ and immediately remove all interference from $f_1$ . The EUT should immediately attempt transmission on $f_1$ (but at least 20 ms after the interference on $f_2$ is applied), verify the transmission only on $f_1$ .	EUT transmission $f_1$	Pass

**7) Random waiting, FCC §15.323(c) (6)**

If the selected combined time and spectrum windows are unavailable, the device may either monitor and select different windows or seek to use the same window after waiting an amount of time, randomly chosen from a uniform random distribution between 10 and 150 milliseconds, commencing when the channel becomes available.

**Test procedure:**

This test is for EUTs that transmit control and signaling channels and that use the provisions of FCC §15.323(c)(6), thus to verify that the EUT (if in deferral) waits for a channel to go clear, then implements a 10 ms to 150 ms holdoff prior to using the channel. FCC §15.323(c)(6) is not restrictive for EUTs that use the LIC and offer 20 or more duplex communications channels, as a combined time and spectrum window cannot become unavailable as there is no threshold limit. Test method according to ANSI C63.17 2013 clause 8.1.3

- a) Restrict operation of the EUT to a single carrier designated  $f_1$ . For TDMA system, further restrict EUT transmission to a single timeslot of the usable timeslots available in the TDMA frame structure and synchronize the interference so as to occur centered within the timeslot.
- b) Activate the EUT with no interference present. The EUT must transmit on  $f_1$ . Then apply CW interference on  $f_1$ . The interference level shall be at  $T_L + U_M$  as appropriate for EUTs that do or do not meet the requirements for using the upper threshold. The EUT must stop transmitting within 30 s.

- c) Cancel the interference. Measure the time interval between the end of the interference transmission and the beginning of transmission by the EUT.
- d) Repeat step b) and step c) 100 times. If the measured time intervals vary uniformly between 10 ms and 150 ms, the EUT passes the test.

Note: This is Not Applicable

**8) Monitoring Bandwidth and Reaction Time, FCC §15.323(c) (7)**

The monitoring system bandwidth must be equal to or greater than the emission bandwidth of the intended transmission and have a maximum reaction time less than  $50 \times \text{SQRT}(1.25/\text{emission bandwidth in MHz})$  microseconds for signals at the applicable threshold level but shall not be required to be less than 50 microseconds

**Test procedure:**

Measurement method according to ANSI C63.17 2013 clause 7.5

- a) Restrict the EUT to a single transmit carrier frequency  $f_1$ , and verify that the EUT can establish a connection with no interference applied on  $f_1$ .
- b) Apply time-synchronized, pulsed interference on  $f_1$  at the pulsed level  $TL + UM$ , verify that the EUT does not establish a connection when the width of the interference pulse exceeds the largest of 50  $\mu\text{s}$  and  $50 \sqrt{1.25 / B}$   $\mu\text{s}$ , where  $B$  is the emission bandwidth of the EUT in megahertz.
- c) With the channel interference level 6 dB above  $TL + UM$ , verify that the EUT does not establish a connection when the width of the interference pulse exceeds the largest of 35  $\mu\text{s}$  and  $35 \sqrt{1.25 / B}$   $\mu\text{s}$ , where  $B$  is the emission bandwidth of the EUT in megahertz.

Test Pulse width Equation ( $\mu\text{s}$ )	B(bandwidth) (MHz)	Pulse width ( $\mu\text{s}$ )	Limit (largest) ( $\mu\text{s}$ )
$50 (1.25/B)^{1/2}$	1.4423	46.55	50
$35 (1.25/B)^{1/2}$	1.4423	32.58	35

**Test result:**

**1) Monitoring Bandwidth:**

The antenna of the EUT used for monitoring is the same interior antenna that used for transmission, so the monitoring system bandwidth is equal to the emission bandwidth of the intended transmission

**2) Reaction Time Test:**

No.	Interference Pulse width ( $\mu\text{s}$ )	Reaction of EUT	Observing time ( $\mu\text{s}$ )	Result
1	50 $\mu\text{s}$ with level $T_L+U_M$	No transmission	24.55	Pass
2	35 $\mu\text{s}$ with level $T_L+U_M+6\text{dB}$	No transmission	17.78	Pass

**9) Monitoring Antenna, FCC §15.323(c) (8)**

The monitoring system shall use the same antenna used for transmission, or an antenna that yields equivalent reception at that location.

**Test procedure:**

Measurement method according to ANSI C63.17- 2013 paragraph 4

**Test result:**

The antenna of the EUT used for transmission is the same interior antenna that used for monitoring.

**10) Monitoring threshold relaxation, FCC §15.323(c) (9)**

Devices that have a power output lower than the maximum permitted under the rules can increase their monitoring detection threshold by one decibel for each one decibel that the transmitter power is below the maximum permitted.

**Test procedure:**

Measurement method according to ANSI C63.17 -2013 paragraph 4

**Test result:**

This requirement is covered by the results of Least Interfered Channel (LIC) based on FCC §15.323(c)(5).

**11) Duplex Connections, FCC §15.323(c) (10)**

An initiating device may attempt to establish a duplex connection by monitors both its intended transmit and receive time and spectrum windows. If both the intended transmit and receive time and spectrum windows meet the access criteria, then the initiating device can initiate a transmission in the intended transmit time and spectrum window. If the power detected by the responding device can be decoded as a duplex connection signal from the initiating device, then the responding device may immediately begin transmitting on the receive time and spectrum window monitored by the initiating device.

**Test procedure:**

This test validates proper operation of an EUT that operates according to the provisions of FCC §15.323(c)(10) using a check of both transmit and receive channels on one end of the link to qualify both ends of the link for transmissions. Test method according to ANSI C63.17 clause 8.3.2 Validation of dual access criteria check for EUTs that implement the upper threshold

- a) Adjust the path loss between the EUT and its companion device such that the received signal to the EUT from the companion device is at least 40 dB above  $TL + UM$ .
- b) Restrict the EUT and its companion device to operation at a single carrier  $f_1$  for TDMA systems and on  $f_1$  and  $f_2$  and corresponding duplex carriers for FDMA systems. Verify that the EUT and its companion device can establish a connection on a time/spectrum window on the enabled carrier(s). Terminate the connection.

- c) Apply interference to the EUT on the EUT’s *transmit* time/spectrum windows at  $TL + UM$  per carrier on all time/spectrum windows except for one, which has interference at least 10 dB below  $TL$ . Adjust the interference to the EUT on its *receive* time/spectrum windows such that a single time/spectrum window has interference at least 10 dB below  $TL$ , and the interference on the other time/spectrum windows is at  $TL + UM + 7$  dB. The interference to the companion device should be at least 10 dB below  $TL$  on all active time/spectrum windows. The interference-free *receive* time/spectrum window must not be the duplex mate of the interference-free *transmit* time/spectrum window.
- d) Cause the EUT to attempt to establish a connection. The connection should be made on the interference-free *receive* time/spectrum window and its duplex mate. Otherwise, the EUT fails the test.
- e) If a connection exists, terminate it. Reduce the interference on the EUT’s *receive* time/spectrum windows to a level of  $TL + UM$  per carrier on all time/spectrum windows except for one, which has interference at least 10 dB below  $TL$ . Raise the interference on the EUT’s *transmit* time/spectrum windows to a level of  $TL + UM + 7$  dB, maintaining one time/spectrum window with interference at least 10 dB below  $TL$ . The interference to the companion device should be at least 10 dB below  $TL$  on all active time/spectrum windows. Again, the interference-free *transmit* and *receive* time/spectrum windows should not constitute a duplex pair if the system designates a specific duplex pairing for time/spectrum windows.
- f) Cause the EUT to attempt to establish a connection. The connection should be made on the interference-free *transmit* time/spectrum window and its duplex mate. Otherwise, the system fails the test.

**Test result:**

Interference (Refer to ANSI C63.17 § 8.3.2)	Reaction of EUT	Results
a) Only a single carrier $f1$ for EUT TDMA systems and on $f1$ and $f2$ and corresponding duplex carriers for FDMA systems.	EUT can transmit	Pass
b) All Tx windows with level $TL+UM$ except one & Rx windows with level $TL+UM+7dB$ except one, which are not the duplex mate.	Connected on the target Rx window and its duplex mate.	Pass
c) All Tx windows with level $TL+UM+7dB$ except one & Rx windows with level $TL+UM$ except one, which are not duplex mate.	Connected on the target Tx window and its duplex mate.	Pass
d) All Tx & Rx windows with level $TU+UM$ , except one for Tx window & one for Rx window, which are not duplex mate.	No connection possible	Pass

**12) Alternative monitoring interval, FCC §15.323(c) (11)**

An initiating device that is prevented from monitoring during its intended transmit window due to monitoring system blocking from the transmissions of a co-located (within one meter) transmitter of the same system, may monitor the portions of the time and spectrum windows in which they intend to receive over a period of at least 10 milliseconds. The monitored time and spectrum window must total at least 50 percent of the 10 millisecond frame interval and the monitored spectrum must be within 1.25 MHz of the center frequency of channel(s) already occupied by that device or co-located co-operating devices. If the access criteria is met for the intended receive time and spectrum window under the above conditions, then transmission in the intended transmit window by the initiating device may commence.

**Test procedure:**

This test validates the ability of the EUT to distinguish between same-system and other-system interference for purposes of satisfying the requirement of 47CFR15.323(c) (11). Test method according to ANSI C63.17 2013 clause 8.4

- a) Adjust the path loss between the EUT and its companion device such that the received signal to the EUT from the companion device is at least 30 dB above *TL*.
- b) Restrict the EUT and its companion device to operation at a single carrier *f1* for TDMA systems and on *f1* and *f2* and corresponding duplex carriers for FDMA systems. Verify that the EUT and its companion device can establish a connection.
- c) Apply interference at *TL + UM* per carrier to the EUT on all *transmit* time/spectrum windows on the enabled carrier(s). The interference must use the same physical layer parameters (modulation, frame format, etc.) as the EUT transmissions, but with a system identifier different from that used by the EUT and the companion device. Ensure that the interference level at the companion device is at least 10 dB below *TL*. Apply no interference to the *receive* time/spectrum windows on the enabled carriers.
- d) Cause the EUT to attempt to establish a connection. If a connection is established, the test fails.

**Test result:**

Interference (Refer to ANSI C63.17 § 8.4)	Reaction of EUT	Results
a) Only a single carrier <i>f1</i> for EUT TDMA systems and on <i>f1</i> and <i>f2</i> and corresponding duplex carriers for FDMA systems.	EUT can transmit	Pass
b) Apply interference with same parameters as EUT transmissions on all Tx windows with level <i>TL+UM</i> on the enabled carrier(s) and no interference on the Rx windows on the enabled carriers.	No connection is established	Pass

**13) Fair Access, FCC §15.323(c) (12)**

The provisions of FCC §15.323 (c) (10) or (11) shall not be used to extend the range of spectrum occupied over space or time for the purpose of denying fair access to spectrum to other devices.

**Test result:**

The manufacturer declares that this device does not use any mechanisms as provided by FCC §15.323(c)(10) or (11) to extend the range of spectrum occupied over space or time for the purpose of denying fair access to spectrum to other device.

**14) Frame Repetition Stability Frame Period and Jitter, FCC§15.323 (e)**

The frame period (a set of consecutive time slots in which the position of each time slot can be identified by reference to a synchronizing source) of an intentional radiator operating in these sub-bands shall be 20 milliseconds or 10 milliseconds/X where X is a positive whole number. Each device that implements time division for the purposes of maintaining a duplex connection on a given frequency carrier shall maintain a frame repetition rate with a frequency stability of at least 50 parts per million (ppm). Each device which further divides access in time in order to support multiple communication links on a given frequency carrier shall maintain a frame repetition rate with a frequency stability of at least 10 ppm. The jitter (time-related, abrupt, spurious variations in the duration of the frame interval) introduced at the two ends of such a communication link shall not exceed 25 microseconds for any two consecutive transmissions. Transmissions shall be continuous in every time and spectrum window during the frame period defined for the device.

**Test procedure:**

Measurement method according to ANSI C63.17 -2013 clause 6.2.2, 6.2.3

**Test result:**

Frame Period and Jitter:

Max. pos. Jitter ( $\mu$ s)	Max. neg. Jitter ( $\mu$ s)	Frame period (ms)	Limit	
			Frame Period (ms)	Jitter ( $\mu$ s)
0.06	-0.08	10.04	20 or 10/X	0.25

Note: X is a positive whole number.
