Low-noise amplifier 1 to 18 GHz	ALC	2648
Power meter 8541B	Gigatronics	3479
Power sensor 80401A	Gigatronics	3182
Multimeter 77-2	Fluke	0812

Test set up:

The system is tested in an open area test site (OATS).

The test unit is placed on a rotating table, 0.8 m from a ground plane. Zero degree azimuth corresponds to the front of the equipment under test.

We use for this measure outdoor test site, by substitution method. The measuring distance between the equipment and the test antenna is 3 m. The antenna have been oriented in the two polarizations, we have recorded only highest level.

In first the spectrum analyzer is replaced by a diode detector which is connected to the vertical channel of an oscilloscope.

The equipment under test is then substituted by a signal generator with a calibrated double ridged guide antenna, and its level adjusted such that the deviation of the Y-trace of the oscilloscope reaches the level obtained with the E.U.T.

The output power level of the signal generator is measured with a calibrated RF power meter.

Then a measurement of the electro-magnetic field is realized, with a resolution bandwidth and video bandwidth adjusted at 1 MHz.

Distance of antenna: 3 meters**Antenna height:** 1 to 4 meters**Antenna polarization:** vertical and horizontal**Equipment under test operating condition:**

The equipment is blocked in continuous transmission mode, modulated by internal data signal.

The polarity column refers to the antenna polarity at which the maximum emissions level is measured.

As the dwell time per channel of the hopping signal is less than 100 ms, the reading of any spurious that falls in a restricted band as defined in section 15-205 may be adjusted by a “duty cycle correction factor” derived from $20 \log(\text{dwell time} / 100 \text{ ms})$ according to the public notice DA 00-705.

We have noted:

dwell time = 436 μ s (see annex 2)

which gives correction factor of $20 \log(436 \times 10^{-3} / 100) = -47.2 \text{ dB}$

* restricted band of operation as defined in section 15-205, limit corresponding to section 15-209.

N.A.: Not Applicable

Applicable limit: In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the RF power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power.

The highest level recorded in a 100 kHz bandwidth is 107.67 dB μ V/m on channel 79. So the applicable limit is 87.67 dB μ V/m.
