3.2. General Description

The Equipment Under Test (EUT) AIR 1672 B48 B77D is an Ericsson Radio Unit working in the wireless communication services 3700-3980MHz band which provides communication connections to 3700-3980MHz network. The AIR 1672 B48 B77D operates from 100-240V AC power source.

The EUT includes 16 TX/RX ports. It can operate in NR mode. It can be configured to transmit in MIMO mode which was used for measurements as the worst configuration. The complete testing was performed with the EUT transmitting at maximum RF power unless otherwise stated. The path loss between the EUT and the spectrum analyzer was measured and recorded for the test band using signal generator and spectrum analyzer. The worst case path loss was entered into the spectrum analyzer as an offset.

A full technical description can be found in the Manufacturer's documentation.

3.3. Configuration Description

The following settings were used to represent all traffic scenarios. The output power was measured on the bottom, middle and top channel of all applicable antenna ports. By measuring the output power of QPSK, 16QAM, 64QAM and 256QAM for NR on one of the antenna ports, it was determined that 256QAM was the worst case modulation scheme and was used for all testing.

Complete testing was carried out on the worst case antenna port which was established as being the highest output power from the applicable measured ports on worst case modulation scheme. This antenna port was Port 5 for NR mode.

The settings below were used for all measurements unless otherwise noted:

A.1.2 Method of Measurements

During the process of testing, the EUT was configured to transmit on maximum power and proper modulation. The transmitter power shall be measured in terms of a root-mean-square (RMS) average value. In case of the EUT was configured to MIMO mode, since the EUT transmits on all antennas simultaneously in the same frequency range, using the Measure-and-Sum approach, the output power at all antennas were tested, and the total output power were then summed mathematically in linear power units according to FCC KDB 662911 D01.

A peak to average ratio measurement is performed at the conducted ports of the EUT for single carrier for single RAT mode. The spectrum analyzers Complementary Cumulative Distribution Function (CCDF) was used and 0.1% probability value recorded.

A.2.1 Reference

FCC CFR 47 Part 2, Clause 2.1049

FCC CFR 47 Part 27, Clause 27.53 (m)

A.2.2 Method of Measurements

The EUT was set to transmit at maximum power. Using the Occupied Bandwidth measurement function in the spectrum analyzer, the occupied bandwidth was measured in accordance with ANSI 63.26.

- a) The spectrum analyzer center frequency is set to the nominal EUT channel center frequency. The frequency span for the spectrum analyzer shall be set wide enough to capture all modulation products including the emission skirts (i.e., two to five times the OBW).
- b) The nominal IF filter bandwidth (3 dB RBW) shall be in the range of 1 to 5 % of the anticipated OBW, and the VBW shall be at least 3 times the RBW.
- c) Set the reference level of the instrument as required to keep the signal from exceeding the maximum input mixer level for linear operation. In general, the peak of the spectral envelope must be at least $10\log(\text{OBW} / \text{RBW})$ below the reference level.
- d) Use the 99% power bandwidth function of the spectrum analyzer and report the measured bandwidth.

A.3 Transmitter unwanted emissions at Band Edge

A.3.1 Reference

FCC CFR 47 Part 2, Clause 2.1051

FCC CFR 47 Part 27, Clause 27.53(l)

A.3.2 Method of measurement

The conducted power of any emission outside the licensee's authorized bandwidth shall not exceed -13 dBm/MHz.

For MIMO mode configurations, the limit was adjusted with a correction of -12.05dB [10Log16] by using the Measure and Add 10Log(N) dB technique according to KDB 662911 D01 Multiple Transmitter Output accounting for simultaneous transmission from antenna ports. Then the limit was adjusted to -25.05dBm.

In the 1 MHz bands immediately outside and adjacent to the frequency block, a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed and a RBW of 1MHz for measurements of emissions > 1MHz away from the band edges.

The limit was adjusted with -10.11dB [10Log(39/400)] to compensate for the reduced measurement bandwidth 39kHz for emission less than 1MHz away from the NR 40MHz and 2C 20MHz band edges.

The limit was adjusted with -9.86dB [10Log(62/600)] to compensate for the reduced measurement bandwidth 62kHz for emission less than 1MHz away from the NR 60MHz band edges.

The limit was adjusted with -9.90dB [10Log(82/800)] to compensate for the reduced measurement bandwidth 82kHz for emission less than 1MHz away from the NR 80MHz and 2C 40MHz band edges.

The limit was adjusted with -10.00dB [10Log(100/1000)] to compensate for the reduced measurement bandwidth 100kHz for emission less than 1MHz away from the NR 100MHz, 2C 60MHz, 2C 80MHz and 2C 100MHz band edges.

Spectrum analyzer detector was set as RMS.

A.3.3 Measurement limit

The conducted power of any emission outside the licensee's authorized bandwidth shall not exceed -13 dBm/MHz.
