Accreditations (Flextronics)

The Design Validation Centre (DVC) test facilities are accredited by the Standards Council of Canada (SCC) to ISO/IEC 17025 in accordance with the scope of accreditation outlined at the web site http://palcan.scc.ca/Specs/PDF/95_e.pdf. The SCC is a signatory of the APLAC [4] and ILAC [14] Mutual Recognition Arrangements. The SCC's Laboratory Accreditation Program has been evaluated and has demonstrated its competence to operate according to the requirements of ISO/IEC 17011.

1.3 CONFIGURATION DESCRIPTION

The RD 2242 B5 / KRY 901 332/1 supports Single, Multi Carrier and Mixed Mode operation from either a single or dual port configuration.

The RD 2242 B5 / KRY 901 332/1 supports LTE Test Models E-TM1.1, E-TM3.1, E-TM3.2 and WCDMA Test Models TM1, TM5 and TM6 in Band 5 (869 MHz – 894 MHz). LTE Test Models (as defined in 3GPP TS 36.141) E-TM1.1, E-TM3.1 and E-TM3.2 were used to represent QPSK, 64QAM and 16QAM modulation respectively and WCDMA Test Models (as defined in 3GPP TS 25.141) TM1, TM5 and TM6 were used to represent QPSK, 16QAM and 64QAM modulation respectively.

The RD 2242 B5 has been tested and authorized for LTE and WCDMA SC, MC and MM transmission. The Test Model used, unless otherwise stated, for LTE was E-TM1.1 and WCDMA TM5.

For TX test cases: Maximum Conducted Output Power, Spurious Emissions at Antenna Terminals (± 1 MHz) and Conducted Spurious Emissions, measurements were performed on both RF Ports using a test limit accounting for MIMO operation with 2 ports. All RF ports were tested for RF Carrier Power and results recorded using the Measure and Sum approach to account for MIMO operation. The test limits shown are representative of the worst case. All testing was performed with the EUT transmitting at maximum RF power unless otherwise stated.

The EUT was powered via POE (Power Over Ethernet) from the IRU 2242 using a -48V DC Power supply.

TECHNICAL DESCRIPTION (a brief description of the intended use and operation)	The RD 2242 B5 (KRY 901 332/1) is a Remote Radio Unit forming part of the Ericsson Radio Base Station (RBS) equipment. The RD provides radio access for mobile and fixed devices and is intended for the indoor environment. The radio operates over 2 Transmit ports in MRO; Single, Multi-Carrier, and MIMO transmission with a maximum rated RF Output of 0.05W per port over an operational temperature of 5°C to +40°C. The unit is designed to be ceiling mounted.

1.5 PRODUCT INFORMATION

1.5.1 Technical Description

The RD 2242 B5 (KRY 901 332/1) is a multi-standard radio forming part of Ericsson's RBS 6000 series Radio Base Station (RBS) equipment. The RD 2242 (Radio Dot System) product provides radio access for mobile and fixed devices and is intended for the indoor environment.

An RDI (Radio Dot Interface) cable provides the RD 2242 with a power, control and digital communications between the RD 2242 and RBS. The location of the RD 2242 with respect to the RBS is limited to a distance of 100 metres.

The RD 2242 B5 supports two (2) Transmit / Receive ports operating in the Band 5 at a Downlink (transmit) frequency from 869 MHz to 894 MHz and an Uplink (receive) frequency from 824 MHz to 849 MHz. The radio operates in FDD (Frequency Division Duplex) with a duplex spacing of 45 MHz and supports operation on multi Radio Access Transmission Standards (RATS) at transmit carrier bandwidths up to 10 MHz.

The radio operates over 2 transmit ports in Single, Multi-Carrier, and Mixed Mode MIMO transmission with a maximum rated RF output power of 50mW per port over an operational temperature of +5° C to +40° C.

A full technical description can be found in the Manufacturer's documentation.

1.6 TEST SETUP

Test Setup, Conducted Measurement:

RD 2242 B5 RU Radio Compliance Set-Up

See Section 3 for a list of the test equipment used in the test.

Test Setup, Radiated Measurement:

Reference: Flextronics Design Validation Centre, Canada Report Reference Number K002569-TR-EMC-05_R1.

1.7 TEST CONDITIONS

For all tests the EUT was set up in accordance with the relevant test standard and to represent typical operating conditions. Tests were applied with the EUT situated in a shielded enclosure, test laboratories or a chamber as appropriate.

The EUT was powered from a -48V DC supply via POE (Power Over Ethernet).

1.8 DEVIATION FROM THE STANDARD

No deviations from the applicable test standards or test plan were made during testing.

1.9 MODIFICATION RECORD

No modifications were made to the EUT during testing.

1.10 ALTERNATIVE TEST SITE

Under our group UKAS Accreditation, TÜV SÜD Product Service conducted the following tests at Ericsson in Ottawa, Canada.

1.11 ADDITIONAL INFORMATION

Testing performed in the presence of Mr Denis Lalonde and Ms Diana Gradinaru.

2.1.4 Environmental Conditions

Ambient Temperature	27.3 - 27.7°C
Relative Humidity	18.5 - 21.1%

2.1.5 Test Method

The EUT was connected to a Spectrum Analyser via 20dB of attenuation. The path loss between the EUT and the Spectrum Analyser was measured using a Network Analyser. The measured path loss was entered as a Reference Level Offset in the Spectrum Analyser.

Measurements were performed with the Spectrum Analyser Band Power measurement function in accordance with FCC KDB 971168 D01 v02r02. The detector was set to RMS with a RBW of at least 1% of the theoretical signal bandwidth and a VBW of 3 times the RBW. The detection bandwidth was configured to be wider than the total bandwidth of the carrier or combinations of carriers, (multi-carrier). The sweep time was set to Auto and 200 averages were performed before the result was recorded. Prior to testing, comparative measurements were made with an Average Power sensor and Power Meter to confirm correlation with the method used.

Due to Average measurements being recorded, an additional Peak to Average measurement was made in all single carrier configurations. This was achieved using the CCDF function of the Spectrum Analyser with the RBW being set to 80MHz (In this case 10MHz was the total RF Bandwidth in single and multi-carrier mode). A comparison was made with a wide band Power Meter capable of measuring Peak to Average ratio to confirm correlation with the method used.

Testing was performed on both ports.

The EUT was connected to a Spectrum Analyser via 20dB of attenuation. The path loss between the EUT and the Spectrum Analyser was measured using a Network Analyser. The measured path loss was entered as a Reference Level Offset in the Spectrum Analyser. The Spectrum Analyser RBW was configured to be at least 1% of the channel bandwidth of the carrier to be measured.

The Spectrum Analyser Occupied bandwidth measurement mode was used in conjunction with an RMS detector and a long sweep time (as described in the operating manual for the test equipment) for the 26dB and 99% Occupied Bandwidth measurements on Bottom, Middle and Top Channels. Testing was performed on both ports.

The results are shown in the plots below.

2.4.3 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.4.4 Environmental Conditions

Ambient Temperature	27.3 - 27.7°C
Relative Humidity	18.5 - 21.1%

2.4.5 Test Method

The EUT was connected to a Spectrum Analyser via 20dB of attenuation for measurements from 9KHz to 9GHz except for the measurement band between 1.34GHz to 6GHz where 20dB of attenuation and a high pass filter were used.

A Network Analyser was used to calibrate the path loss between the EUT and the Spectrum Analyser and the worst case path loss in the measured ranges was entered as a reference level offset.

Over the measured ranges, the analyser RBW was set to 1MHz, VBW 3MHz with an RMS detector used in conjunction with a trace Max Hold to give the required average result.

Testing was performed on both ports in configurations of the EUT as reported below. The test limits were set to a worst case value of -16dBm.

The results are shown in the plots below.

2.5.3 Test Equipment Used

The major items of test equipment used for the above tests are identified in Section 3.1.

2.5.4 Environmental Conditions

Ambient Temperature 27.3°C
 Relative Humidity 18.5%

2.5.5 Test Method

The EUT was placed in a Climatic Chamber and connected to a Vector Signal Analyser via an attenuator. The temperature was varied over the range -30°C to +50°C in 10°C steps. At each temperature interval, the EUT was left to stabilise. After this period of time, the mean Frequency Error was measured and recorded on the Middle channel.

At 20°C, the voltage was varied between 85% and 115% of the nominal declared voltage. At each extreme voltage, the mean Frequency Error was measured and recorded on the Middle channel.
