Radio measurements on RD 2242 B17 with FCC ID: TA8BKRY901326-1 and IC: 287AB-AS9013261

(9 appendices)

Test object

Product name: RD 2242 B17
Product number: KRY 901 326/1, see appendix 1 for details.

Summary

Standard		Compliant	Appendix
FCC CFR 47 part 2 and 27 / IC RSS-130 ISSUE 1			
2.1046 / RSS-130 4.4	RF power output	Yes	2
2.1046 / RSS-130 4.4	RF power output, radiated	Yes	3
2.1049 / RSS-Gen 6.6	Occupied bandwidth	Yes	4
2.1051 / RSS-130 4.6	Band edge	Yes	5
2.1051 / RSS-130 4.6	Spurious emission at antenna terminals	Yes	6
2.1053 / RSS-130 4.6	Field strength of spurious radiation	Yes	7
2.1055 / RSS-130 4.3	Frequency stability	Yes	8

Appendix 1

Description of the test object

Radio equipment:	RD 2242 B17 Product number: KRY 901 326/1 FCC ID: TA8BKRY901326-1 IC 287AB-AS9013261 IC MODEL NO : AS9013261
Hardware revision state:	R2B
Tested configuration:	LTE single RAT
Frequency bands:	TX: 734 – 745 MHz RX: 704 – 715 MHz
Antenna ports:	2 TX/RX ports, (internally connected to integrated Omni directional antenna elements)
RF configuration:	Single carrier, multi carrier,TX-diversity and MIMO 2x2
RF power Tolerance:	+2.0 dB, -2.7 dB
Nominal output power per antenna port:	Single carrier: 1 x 17 dBm (1 x 50mW) Multi carrier: 2 x 14 dBm (2 x 25mW)
Antenna type:	Omni directional antenna
Antenna gain:	-2.6 dBi
Channel bandwidths:	Singel carrier: 5 MHz, 10 MHz Multi carrier: 5 MHz
Modulations:	QPSK, 16QAM and 64QAM
Nominal supply voltage:	-48 VDC (associated equipment)

Operation mode during measurements

Measurements were performed with the test object transmitting test models as defined in 3GPP TS 36.141. Test model E-TM1.1 represent QPSK modulation, test model E-TM3.2 represent 16QAM modulation and test model E-TM3.1 represent 64QAM modulation.

The settings below were deemed representative for all traffic scenarios when settings with different modulations, channel bandwidths, number of carriers and RF configurations has been tested to find the worst case setting. All measurements were performed with the test object configured for maximum transmit power. The settings below were used for all measurements if not otherwise noted.

MIMO mode, single carrier: E-TM1.1
MIMO mode, multi carrier: 2 carriers E-TM1.1

Cable configurations between RD and IRU

The cables, used during tests, correspond to minimum and maximum length, according to clause 2.9 in Exhibit 12 – Technical Circuit Description. The following cable configurations has been used:

RDI Cable 20m: total cabel length 20m patch cables included.

RDI Cable 92m: total cabel length 92m patch cables included.

RDI Cable 200m: total cabel length 200m patch cables included.

Patch cable	Cat 6a Schneider Electric Actassi CL-MNC6A
RDI cable	Cat 6a Schneider Electric Actassi CL-MXC6A

Conducted measurements

The conducted measurements were performed on RD 2242 B17 with
product number KRY 901 326/1.

The test object was mounted in a fixture and powered by the RBS Main Unit via the RDI LAN cable.
All TX parameters were measured at port RF B with port RF A terminated into 50 ohm. Complete measurements were made on RF B with additional measurements on RF A to verify that the ports are identical.

Radiated measurements

The test object was mounted in a fixture and powered by the RDI LAN cable. In field strength of spurios radition both RF ports were terminated into 50 ohm. For RF power output measurement the internal antenna was used.

Purpose of test

The purpose of the tests is to verify compliance to the performance characteristics specified in applicable items of FCC CFR 47 and IC RSS-130 and IC RSS-Gen.

References

Measurements were done according to relevant parts of the following standards:

ANSI 63.4-2009
ANSI/TIA/-603-C-2004
3GPP TS 36.141, version 11.4.0
CFR 47 part 2, December 16th , 2013
CFR 47 part 27, December 16th, 2013
RSS-Gen Issue 4, November 2014
RSS-130 Issue 1, October 2013

Uncertainties

Measurement and test instrument uncertainties are described in the quality assurance documentation ”SP-QD 10885”. The uncertainties are calculated with a coverage factor k=2 (95% level of confidence).
Compliance evaluation is based on a shared risk principle with respect to the measurement uncertainty.

Reservation

The test results in this report apply only to the particular test object as declared in the report.

Delivery of test object

The test object was delivered 2014-12-11.

Manufacturer’s representative

Lars Wallin, Ericsson AB.

Test engineers

Andreas Johnson, Tomas Lennhager, Maulo Rivera, Tomas Isbring, Patrik Augustsson and Rolf Kühn, SP.

Test participants

None.

Limits

§ 27.50 (c) (3): Base stations transmitting in the 698 –746 MHz band with an emission bandwidth greater than 1 MHz must not exceed an ERP of 1000 watts/MHz.

RSS-130 4.4: The transmitter output power shall be measured in terms of average power. For base and fixed equipment, refer to SRSP-518 for power limits
The maximum output power may not exceed 3280 W (EIRP)/ MHz

In addition, the peak-to-average power ratio (PAPR) of the transmitter shall not exceed 13 dB for more than 0.1% of the time and shall use a signal corresponding to the highest PAPR during periods of continuous transmission.

Complies?	Yes

Appendix 3

RF power output measurements according to CFR 47 §27.50 and RSS-130 4.4, radiated

Date	Temperature	Humidity
2015-01-12	22 °C ± 3°C	33 % ± 5 %

Test set-up and procedure

The measurements were performed according to ANSI/TIA-603-C-2004.

The test was performed with continuous transmission.

The RDI cable configuration was 20m. Total cabel length 20m patch cables included.

The test of radiated emission was performed in a semi anechoic chamber. The measurements were performed with both horizontal and vertical polarizations of the antenna. The antenna distance was 3.0 m.

The fundamental was scanned with PEAK-detector with the antenna height was varied between 1-4 m and the turntable was rotated between 0-360 degrees for maximum response. The carrier power was measured with RMS- detector activated with a RBW of 1 MHz. The output power was verified with the substitution method according ANSI/TIA-603-C-2004. The antenna distance during the measurements was 3.0 m.

Band edge measurements according to CFR 47 2.1051 / RSS-130 4.6

Date	Temperature	Humidity
2014-01-13	22 °C ± 3°C	19 % ± 5%

Test set-up and procedure

The measurements were made per definition in CFR 47 §27.53 The test object was connected to a spectrum analyzer with the RMS detector activated. The spectrum analyzer was connected to an external 10 MHz reference standard during the measurements.

The measurements were made as defined in §27.53 (g). The FCC rules, specifying a RBW of at least 30k up to 100 kHz away from the band edges and a RBW of 100 kHz for measurements of emissions more than 100 kHz away from the band edges.

A resolution bandwidth of 100 kHz was used at the band edges up to 10 MHz from the band edges.

Before comparing the results to the limit, 3 dB [10 log (2)] should be added according to method 2 “measure and add 10 log(N_{ANT})” of FCC KDB662911 D01 Multiple Transmitter Output v02r01.

Remark

The emission at 9 kHz on the plots was not generated by the test object. A complementary measurement with a smaller RBW showed that it was related to the LO feed-through.

The highest fundamental frequency is 745 MHz. The measurements were made up to 8 GHz (10x745 MHz = 7.45 GHz).

Limits

CFR 47 § 27.53 (g) and RSS-130 4.6:

Outside a licensee's frequency band(s) of operation the power of any emission shall be attenuated below the transmitter power (P) by at least 43 + 10 log (P) dB, resulting in a limit of -13 dBm per 100 kHz RBW.

Complies?	Yes

Field strength of spurious radiation measurements according to 47 CFR 27.53 (f) and RSS-130 4.6

Date	Temperature	Humidity
2015-10-17	22 °C ± 3°C	25 % ± 5 %

Test set-up and procedure

The test sites are listed at FCC, Columbia with registration number: 93866. The test site complies with RSS-Gen, Industry Canada file no. 3482A-1.

The measurements were performed with both horizontal and vertical polarization of the antenna. The antenna distance was 3 m in the frequency range 30 MHz – 8 GHz.

In the frequency range 30 MHz – 8 GHz the measurement was performed in power with a RBW of 1 MHz. A propagation loss in free space was calculated. The used formula was $\gamma = 20\log\left(\frac{4\pi D}{\lambda}\right)$, γ is the propagation loss and D is the antenna distance.

The measurement procedure was as the following:

1. A pre-measurement is performed with peak detector. For measurement < 1 GHz the test object is measured in eight directions with the antenna at 1.0 m. For measurements > 1 GHz the test object was measured in seventeen directions with the antenna at 1.0 m in height.
2. Spurious radiation on frequencies closer than 20 dB to the limit in the pre-measurement is scanned 0-360 degrees and the antenna is scanned 1- 4 m for maximum response. The emission is then measured with the RMS detector and the RMS value is reported. Frequencies closer than 10 dB to the limit when measured with the RMS detector were measured with the substitution method according ANSI/TIA-603-C-2004.

The test set-up during the spurious radiation measurements is shown in the picture below:

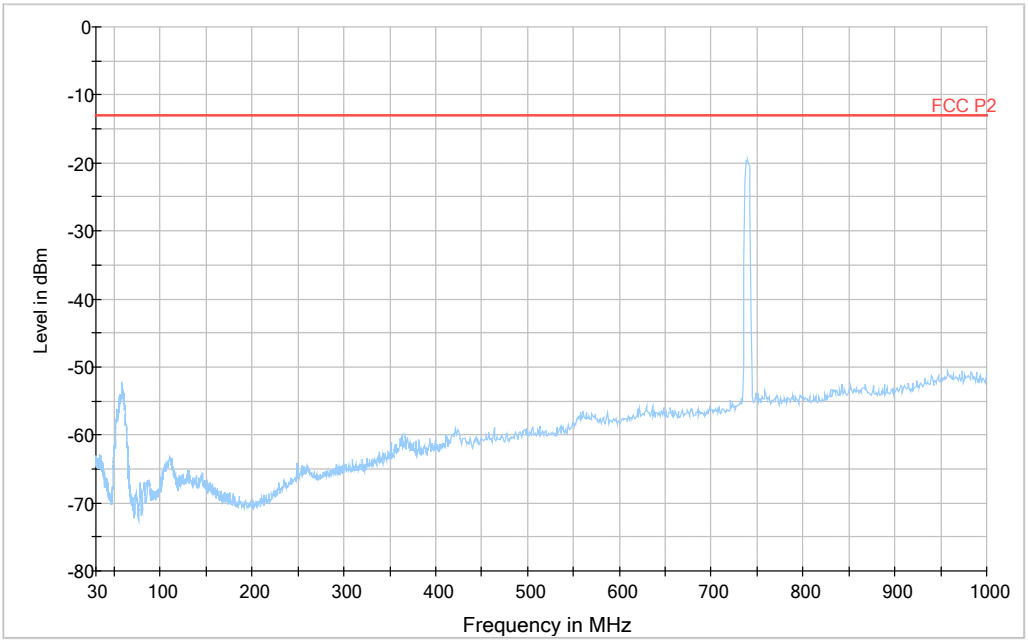
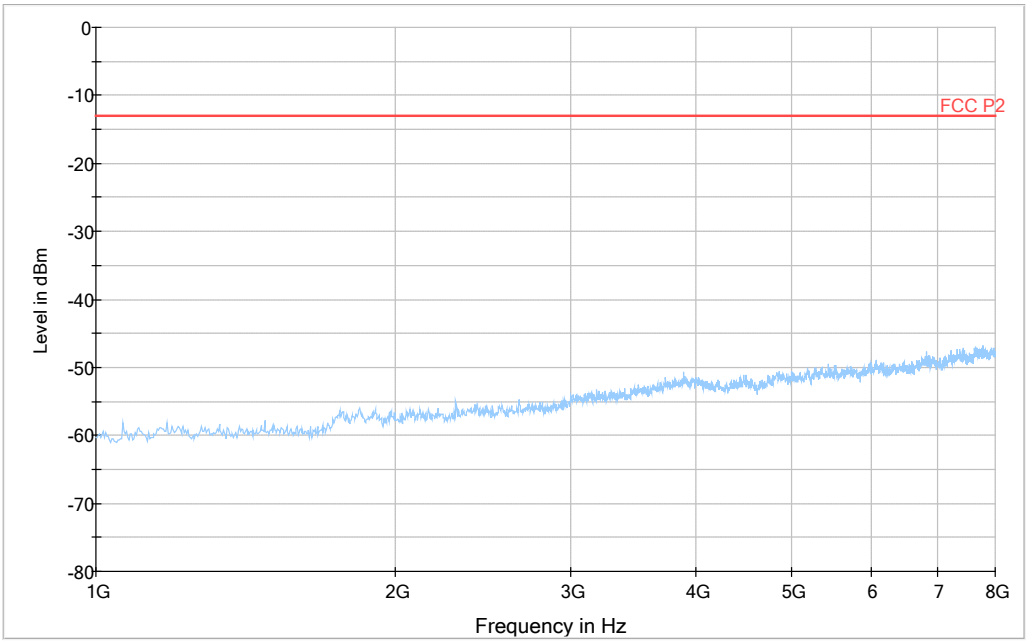
Complies?	Yes

Diagram 1a:



Note: The emission at 739.5 MHz is the carriers frequency and shall be ignored in the context.

Diagram 1b:



Frequency stability measurements according to CFR 47 § 27.54 / IC RSS 130 4.3

Date	Temperature	Humidity
2015-01-14	23 °C ± 3°C	18% ± 5%
2015-01-15	23 °C ± 3°C	18% ± 5%

Test set-up and procedure
The measurement was made per 3GPP TS 36.141. The output was connected to a spectrum analyser. The spectrum analyser was connected to an external 10 MHz reference standard during the measurements.

The measurement was also made using a resolution bandwidth of 1% of the emission bandwidth, a reference point at the unwanted emission level which complies with the attenuation of 43 + 10 log10 p (watts) (i.e. -13dBm) (for MIMO -16dBm) at the band edge of the lowest and highest channel was selected, and the frequency at these points was recorded as fL and fH respectively.

-48.0	+20	5	734.209	209	744.792	1208
-48.0	+20	10	734.427	427	744.576	1424

Measurements according to FCC CFR 47 § 27.54 / IC RSS 130 4.3

The frequency error results clearly shows that the frequency stability is good enough to ensure that the transmitted carrier stay within the operating band.

Remark

It was deemed sufficient to test one combination of TX frequency, channel bandwidth configuration and test model (modulation), as all combinations share a common internal reference to derive the TX frequency from.

Limits

CFR 47 § 27.54 Frequency stability

The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized bands of operation.

RSS-130 4.3 Frequency:
The frequency stability shall be sufficient to ensure that the emission bandwidth stays within the operating frequency block when tested to the temperature and supply voltage variations specified in RSS-Gen.

Complies?	Yes
