

RF exposure statement

This equipment is below the general population low threshold for SAR evaluation based on 80 mW and 0.5 dBi antenna gain.

The low threshold is $60/f\text{GHz} = 60/0.470 = 128 \text{ mW}$ and the maximum output power including antenna gain is $80 \times 1.12 = 90 \text{ mW}$.

This equipment is an industrial remote control.

The user manual provide the following warning statement.

To maintain the distance of 20cm from the body to the antenna as required in the rules the terminal should only be used with the carrying belt.
