

# **RF Exposure Evaluation Declaration**

| Product Name : |   | FlexAP                                       |
|----------------|---|--|
| Model No. :    | : | (For FCC & IC):                              |
|                |   | Flex-AP-ED, Flex-AP-ES, Flex-AP-S, Flex-AP-D |
|                |   | (Only for FCC):                              |
|                |   | Flex-AP-ED-XC, Flex-AP-ES-XC, Flex-AP-S-XC,  |
|                |   | Flex-AP-D-XC                                 |
| FCC ID         | : | TDB-FLEX-AP                                  |

Applicant : Sensys Networks Inc.

Address : Suite 110, 1608 Fourth Street, Berkeley, CA, 94710, USA

| Date of Receipt | : | Jan. 13th, 2017                  |
|-----------------|---|----------------------------------|
| Test Date       | : | Jan. 13th, 2017~ Apr. 06th, 2017 |
| Issued Date     | : | Apr. 27th, 2017                  |
| Report No.      | : | 1712066R-RF-US-P20V02            |
| Report Version  | : | V1.0                             |

The test results relate only to the samples tested.

The test results shown in the test report are traceable to the national/international standard through the calibration of the equipment and evaluated measurement uncertainty herein.

This report must not be used to claim product endorsement by CNAS, TAF or any agency of the government. The test report shall not be reproduced without the written approval of DEKRA Testing & Certification (Suzhou) Co., Ltd.

# Test Report Certification Issued Date : Apr. 27th, 2017 Report No. : 1712066R-RF-US-P20V02

# 1. **RF Exposure Evaluation**

# 1.1. Limits

#### According to KDB 447498 D01 General RF Exposure Guidance v06

#### 4.3.1 Standalone SAR test exclusion considerations

1) The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]  $\cdot [\sqrt{f(GHz)}] \le 3.0$  for 1-g SAR and  $\le 7.5$  for 10-g extremity SAR,where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison
- 3.0 and 7.5 are referred to as the numeric thresholds in the step 2 below

The test exclusions are applicable only when the minimum test separation distance is  $\leq$  50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

2) At 100 MHz to 6 GHz and for test separation distances > 50 mm, the SAR test exclusion threshold is determined according to the following, and as illustrated in Appendix B:

a) [Power allowed at numeric threshold for 50 mm in step 1) + (test separation distance - 50 mm)  $\cdot$  (f(MHz)/150)] mW, at 100 MHz to 1500 MHz

b) [Power allowed at numeric threshold for 50 mm in step 1) + (test separation distance - 50 mm) $\cdot$ 10] mW at > 1500 MHz and ≤ 6 GHz

3) The 1-g and 10-g SAR test exclusion thresholds for below 100 MHz at test separation distances  $\leq$  50 mm are determined by:

a) The power threshold at the corresponding test separation distance at 100 MHz in step 2) is

multiplied by [1 + log(100/f(MHz))] for test separation distances > 50 mm and < 200 mm

b) The power threshold determined by the equation in a) for 50 mm and 100 MHz is multiplied by ½ for test separation distances ≤ 50 mm

c) SAR measurement procedures are not established below 100 MHz. When SAR test exclusion cannot be applied, a KDB inquiry is required to determine SAR evaluation requirements for any test results to be acceptable. Note: when the minimum test separation distance is < 5 mm, a distance of 5 mm is applied to determine SAR test exclusion.

# 1.2. Test Procedure

Software provided by client enabled the EUT to transmit and receive data at lowest, middle and highest channel individually.

The temperature and related humidity:  $18^\circ$ C and 78% RH.

# 1.3. Test Result of RF Exposure Evaluation

| Antenna Type         |             | External Dipole |           |                          |           |  |           |  |  |
|                      |             | Internal        |           | PIFA                     |           |  |           |  |  |
|                      | $\boxtimes$ |                 |           | PCB                      |           |  |           |  |  |
|                      |             |                 |           | Ceramic Chip Antenna     |           |  |           |  |  |
|                      |             |                 | $\square$ | Microstrip Patch Antenna |           |  |           |  |  |
| Antenna Gain         | 5.5dBi      |                 |           |                          |           |  |           |  |  |

Based on The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm and the formula below:

Estimated SAR=
$$\sqrt{f(GHz)} * \frac{(Max Power of channel, mW)}{Min. Separation Distance, mm}$$

| Band | Band Exposure<br>Condition | Pmax    |         |   | f(GHz) | calculation | Stand-alone<br>Test | SAR Test |
|------|----------------------------|---------|---------|---|--------|-------------|---------------------|----------|
|      |                            | (dBm)   | (mw)    | (mm)                                    | .(0)   | result      | exclusion           |          |
|      |                            | (abiii) | (11100) | ((((((((((((((((((((((((((((((((((((((( |        |             | threshold           |          |
| BT   | Body                       | 9.3     | 8.51    | 5                                       | 2.405  | 2.639       | 3.00                | No       |

Conclusion: 2402MHz-2480MHz SAR was not required.

The End
