According to its specifications, the EUT must comply with the requirements of the Section 15.207, 15.209 and 15.247 under the FCC Rules Part 15 Subpart C.

3.3 GENERAL TEST PROCEDURES

Conducted Emissions

The EUT is placed on the turntable, which is 0.8 m above ground plane. According to the requirements in Section 13.1.4.1 of ANSI C63.4 Conducted emissions from the EUT measured in the frequency range between 0.15 MHz and 30MHz using CISPR Quasi-peak and average detector modes.

Test Configuration

Below 1 GHz

Above 1 GHz

TEST PROCEDURE

- 1. The EUT is placed on a turntable, which is 0.8m above ground plane.
- 2. The turntable shall be rotated for 360 degrees to determine the position of maximum emission level.
- 3. EUT is set 10m away from the receiving antenna, which is varied from 1m to 4m to find out the highest emissions.
- 4. Maximum procedure was performed on the six highest emissions to ensure EUT compliance.
- 5. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
- 6. Repeat above procedures until the measurements for all frequencies are complete.

7.6 POWERLINE CONDUCTED EMISSIONS

LIMIT

For an intentional radiator which is designed to be connected to the public utility (AC) power Line, the radio frequency voltage that is conducted back onto the AC power Line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed 250 microvolts (The limit decreases Linearly with the logarithm of the frequency in the range 0.15 MHz to 0.50 MHz). The limits at specific frequency range is listed as follows:

Date of Issue: August 29, 2005

| Frequency Range (MHz) | Limits (dBµV) | | | | | |
|-------------------------|---------------|----------|--|--|--|--|
| Frequency Range (MIIIZ) | Quasi-peak | Average | | | | |
| 0.15 to 0.50 | 66 to 56 | 56 to 46 | | | | |
| 0.50 to 5 | 56 | 46 | | | | |
| 5 to 30 | 60 | 50 | | | | |

Compliance with this provision shall be based on the measurement of the radio frequency voltage between each power Line (LINE and NEUTRAL) and ground at the power terminals.

Test Configuration

See test photographs attached in Appendix 1 for the actual connections between EUT and support equipment.

TEST PROCEDURE

- 1. The EUT was placed on a table, which is 0.8m above ground plane.
- 2. Maximum procedure was performed on the six highest emissions to ensure EUT compliance.
- 3. Repeat above procedures until all frequency measured were complete.

TEST RESULTS

The initial step in collecting conducted data is a spectrum analyzer peak scan of the measurement range. Significant peaks are then marked as shown on the following data page, and these signals are then quasi-peaked.

L1 = Line One (Live Line) / L2 = Line Two (Neutral Line)

Remark:

- 1. The measuring frequencies range between 0.15 MHz and 30 MHz.
- 2. The emissions measured in the frequency range between 0.15 MHz and 30MHz were made with an instrument using Quasi-peak detector and Average detector.
- 3. "---" denotes the emission level was or more than 2dB below the Average limit, and no re-check was made.
- 4. The IF bandwidth of SPA between 0.15MHz and 30MHz was 10KHz. The IF bandwidth of Test Receiver between 0.15MHz and 30MHz was 9kHz.

Note:

Freq. = Emission frequency in KHz

 $Factor(dB) = cable\ loss + Insertion\ loss\ of\ LISN+\ Insertion\ loss\ of\ TRANSIENT\ LIMITER\ (The\ TRANSIENT\ LIMITER\ included\ 10\ dB\ ATTENUATION)$

 $Amptd\ dBuV = Uncorrected\ Analyzer/Receiver\ reading\ +\ cable\ loss\ +\ Insertion\ loss\ of\ LISN+\\ Insertion\ loss\ of\ TRANSIENT\ LIMITER,\\ if\ it > 0.5\ dB$

Limit dBuV = Limit stated in standard
Margin dB = Reading in reference to limit

Calculation Formula

Margin(dB) = Amptd(dBuV) - Limit(dBuV)
