LS Research, LLC in Review

As an EMC Testing Laboratory, our Accreditation and Assessments are recognized through the following:

TESTING CERT #1255.01

<u>A2LA – American Association for Laboratory Accreditation</u>

Accreditation based on ISO/IEC 17025: 2005 with Electrical (EMC) Scope of Accreditation A2LA Certificate Number: 1255.01

Federal Communications Commission (FCC) – USA

Listing of 3 Meter Semi-Anechoic Chamber based on Title 47 CFR – Part 2.948 FCC Registration Number: 90756

Industrie Industry Canada Canada

Canada

Industry Canada

On file, 3 Meter Semi-Anechoic Chamber based on RSS-212 – Issue 1 File Number: IC 3088-A On file, 3 and 10 Meter OATS based on RSS-212 – Issue 1 File Number: IC 3088

U. S. Conformity Assessment Body (CAB) Validation

Validated by the European Commission as a U. S. Competent Body operating under the U. S./EU, Mutual Recognition Agreement (MRA) operating under the European Union Electromagnetic Compatibility –Council Directive 2004/108/EC (formerly 89/336/EEC, Article 10.2).

Date of Validation: January 16, 2001

Validated by the European Commission as a U.S. Notified Body operating under the U.S. /EU, Mutual Recognition Agreement (MRA) operating under the European Union Telecommunication Equipment – Council Directive 99/5/EC, Annex V. Date of Validation: November 20, 2002 Notified Body Identification Number: 1243

| IC: RSS-GEN | AC Maille Ellissions | ANSI C03.4-2005 | 105 | INU |

The TiWi-BLECA was tested and MEETS the following FHSS requirements:

Note 1: Tested in three orthogonal positions.

Note 2: RF Conducted measurement at antenna terminal.

2.0 Test Facilities

All testing was performed at:

LS Research, LLC W66 N220 Commerce Court Cedarburg, Wisconsin, 53012 USA

LS Research, LLC is accredited by A2LA (American Association for Laboratory Accreditation) to the requirements of ISO/IEC 17025, 2005 "General Requirements for the Competence of Calibration and Testing Laboratories".

LS Research, LLC's scope of accreditation includes all test methods listed herein, unless otherwise noted.

3.1 Equipment Under Test (EUT) Information

The following information has been supplied by the applicant.

| <i>v v v</i> | |
|----------------|-------------|
| Product Name: | TiWi-BLECA |
| Model Number: | TiWi-BLECA |
| Serial Number: | Eng. Sample |
| FCC ID | TFB-BLECA |
| IC Number | 5969A-BLECA |

3.2 Product Description

The TiWi-BLECA module is a multi-standard module with support for WLAN (802.11 b/g/n), Bluetooth V2.1 and Bluetooth 4.0.

Bluetooth (FHSS):

| Frequency Range (MHz) | 2402-2480 MHz |
|---|-------------------------------|
| RF Power In Watts (conducted) | Max 7.1 mW; Min 5.5 mW |
| Max Conducted Output Power (dBm) | 8.5 |
| Occupied Bandwidth 99% | 1.23 MHz |
| Type of Modulation | GFSK |
| Emission Designator | 1M23FXD |
| Transmitter Spurious (worst case) at 3 meters | 49.33 dBµV/m @ 2.4835GHz, Avg |
| Stepped (Y/N) | Ν |
| Step Value | N/A |
| Frequency Tolerance %,Hz, ppm | Better than 100 ppm |
| Antenna: Detachable / Non-detachable | Non-detachable |
| Antenna: Type | Chip |
| Antenna Gain (Peak) | 1.3 dBi |
| FCC Rule Part | Title 47 Part 15.247 |
| Industry Canada Rule Part | RSS-210 Issue 8 2010 |
| Modular Filing | Yes |
| RF Exposure Type | Mobile |
| Receiver Spurious (worst case) at 3 meters | 33.2 dBuV/m @ 72.1MHz, OP |

3.3 Modifications Incorporated In the EUT for Compliance Purposes

None noted at time of test

3.4 Deviations & Exclusions from Test Specifications

None noted at time of test

4.0 Conditions of Test

Environmental: Temperature: 20-25° C Relative Humidity: 30-60% Atmospheric Pressure: 86-106 kPa

Mains Voltage: 3.3VDC from bench supply

5.0 Additional Information

The EUT was programmed from a laptop computer with LSR's proprietary control program. Once programmed the radio was powered from a bench supply at 3.3VDC.

6.0 Test Equipment

All test equipment is calibrated by a calibration laboratory accredited by A2LA to the requirements of ISO 17025. For a complete list of test equipment and calibration dates, see Appendix A. Unless otherwise noted, resolution bandwidth of measuring instrument used during testing for given frequency range, see below. For average measurements above 1000MHz the video bandwidth is set at 10Hz.

| Frequency Range | Resolution Bandwidth |
|-------------------|-----------------------------|
| 9 kHz – 150 kHz | 200 Hz |
| 150 kHz – 30 MHz | 9 kHz |
| 30 MHz – 1000 MHz | 120 kHz |
| Above 1000 MHz | 1 MHz |

| Prepared For: LS Research | Name: TiWi-BLECA |

| LSR: C-1808 | Serial: Eng. Sample |
| Page 6 of 44 | |

7.0 Conformance Summary

The EUT was found to MEET the requirements as described within the specification of FCC Title 47, CFR Part 15.247 (2011) and Industry Canada RSS-210, Issue 8 (2010)

If some emissions are seen to be within 3 dB of their respective limits:

As these levels are within the tolerances of the test equipment and site employed, there is a possibility that this unit, or a similar unit selected out of production may not meet the required limit specification if tested by another agency.

LS Research, LLC certifies that the data contained herein was taken under conditions that meet or exceed the requirements of the test specifications. The results in this Test Report apply only to the item(s) tested on the above-specified dates. Any modifications made to the EUT subsequent to the indicated test date(s) will invalidate the data herein, and void this certification.

| Manufacturer | LS Research, LLC |
| Test Location | LS Research, LLC |
| Rule Part | FCC Part 15.247 / RSS-210 Annex 8 |
| General Measurement Procedure | ANSI C63.4-2003 / FCC Public Notice DA 00-705 |
| General Description of Measurement | A direct measurement of the transmitted signal was performed at the antenna port of the EUT via a cable connection to a spectrum analyzer. An attenuator was placed in series with the cable to protect the spectrum analyzer. The loss from the cable and the attenuator were added on the analyzer as gain offset settings there by allowing direct measurements, without the need for any further corrections. The EUT was configured to run in a continuous transmit mode, while being supplied with typical data as a modulation source. |

Channel Plan and Separation

A spectrum analyzer was used with a resolution bandwidth of 30 kHz to measure the channel separation of the Bluetooth FHSS Radio on the TiWi product.

The minimum and maximum channel-separations measured for this device are 997.50 kHz and 1021.25 kHz respectively. The maximum occupied bandwidth of the device, as reported in the previous section is 875.00 kHz. The following plots describe this spacing, and also establish the channel separation and plan.

Data Table

| RANGE (MHz) | # OF CHANS | Max separation (Hz) |
|---------------|------------|---------------------|
| 2400 - 2410.5 | 9.0 | 997.50 |
| 2410.5 - 2420 | 9.5 | 1021.25 |
| 2420 - 2430 | 10.0 | 1000.00 |
| 2430 - 2440 | 10.0 | 1000.00 |
| 2440-2450 | 10.0 | 1000.00 |
| 2450-2460 | 10.0 | 1000.00 |
| 2460-2470 | 10.0 | 1000.00 |
| 2470-2483.5 | 10.5 | 1011.25 |

| Frequency Range of Measurement | Biconical: 30-300 MHz | Log Periodic Dipole Array: 300-1000 MHz | Double-Ridged Waveguide Horn: 1-18 GHz | Standard Gain Horn: 18-25GHz | | | |
| Measurement Detectors | 30-1000MHz Peak Detector RBW: 120 kHz VBW: 300 kHz | | 1 - 25 GHz: Peak Detector RBW : 1MHz VBW: 3MHz (Peak M VBW: 10Hz (Average | Aeasurement) e Measurement) | | | |
| Description of Measurement | The antenna, cable, pre-amp, and other necessary measurement system correction factors are loaded onto the EMI receiver / spectrum analyzer when the measurements are preformed. The data is gathered and reported as the corrected values. The EUT is placed on a non-conductive pedestal centered on a turn-table in the test location with the antenna at the test distance from the EUT Maximum radiated RF emissions are determined by rotation of azimuth and scanning the sense antenna between 1 and 4 meters in height using both horizontal and vertical antenna polarities. Maximized levels are manually noted at degree values of azimuth and at sense antenna height. | | | | | | |
| Example Calculations | Reported Measuremen Cable factor (dB) - applicable) | nt data = Raw receiver amplification factor (v | measurement + Antenr vhen applicable) + Ad | a Correction Factor + ditional factor (when | | | |

B.3 – AC Mains Emissions

Test Setup

The test area and setup are in accordance with ANSI C63.4-2003 and with Title 47 CFR, FCC Part 15, Industry Canada RSS-210 and RSS GEN. The EUT was placed on a non-conductive wooden table, with a height of 80 cm above the reference ground plane. The EUT's power cable was plugged into a 50 Ω (ohm), Line Impedance Stabilization Network (LISN). The AC power supply of 120V was provided inside the 3 Meter Semi-Anechoic Chamber via an appropriate broadband EMI Filter, and then to the LISN line input. Final readings were then taken and recorded. After the EUT was setup and connected to the LISN, the RF Sampling Port of the LISN was connected to a 10 dB Attenuator-Limiter, and then to the EMI Receiver. The LISN used has the ability to terminate the unused port with a 50 Ω (ohm) load when switched to either L1 (line) or L2 (neutral).

Test Procedure

The EUT was investigated in continuous modulated transmit mode for this portion of the testing. The appropriate frequency range and bandwidths were selected on the EMI Receiver, and measurements were made. The bandwidth used for these measurements is 9 kHz, as specified in CISPR 16-1, Section 1, Table 1, for Quasi-Peak and Average detectors in the frequency range of 150 kHz to 30 MHz. Final readings were then taken and recorded.

Test Equipment Utilized

A list of the test equipment and accessories utilized for the Conducted Emissions test is provided in Appendix A.

Test Results

The EUT was found to **MEET** the Conducted Emission requirements of FCC Part 15.207 and 15.107 Conducted Emissions for an Intentional Radiator as well as IC RSS 210 and RSS GEN. See the Data Charts and Graphs for more details of the test results.

FCC Limits of Conducted Emissions at the AC Mains Ports

| Frequency Range (MHz) | Quasi-Peak Limit (dBµV) | Average Limit (dBµV) | | | |
|---|-------------------------|----------------------|--|--|--|
| 0.150 -0.50 * | 66-56 | 56-46 | | | |
| 0.5 - 5.0 | 56 | 46 | | | |
| 5.0 - 30 | 60 | 50 | | | |
| * The limit decreases linearly with the logarithm of the frequency in this range. | | | | | |

The follow table represents the limits for Conducted Emissions Class B taken from CFR 15.207:

Sample calculation for the limits in the 0.15 to 0.5 MHz:

Limit = -19.12 (Log₁₀ (F [MHz] / 0.15 [MHz])) + 66.0 dB μ V

For a frequency of 200 kHz for example:

Quasi-Peak Limit (F=200 kHz) = -19.12 (Log₁₀ (0.2[MHz] / 0.15 [MHz])) + 66.0 dBµV

Quasi-Peak Limit (F=200 kHz) = $63.6 \text{ dB}\mu\text{V}$

Average Limit (F=200 kHz) = -19.12 (Log₁₀ (0.2[MHz]/0.15[MHz])) + 56.0 dBµV

Average Limit (F = 200 kHz) = 53.6 dB μ V

Appendix F – Duty Cycle Measurements

Justifications of Average Duty Factor Calculations

BLUETOOTH RADIO

Average (Relaxation) Factor

Average Factor = 20^* Log_{10} (Worst Case EUT On-time over 100 ms time window)

The transmit packet occupies 0.98 ms of time, within any 100 ms window. Therefore, the relaxation factor allowance is calculated as:

Average Factor = $20^* \text{ Log}_{10} (.98 / 100 \text{ ms}) = 40.18$

A maximum relaxation factor of 20 dB would be allowable for this product.
