### **2.3 - EUT'S Details.**

The LS Research, LLC TiWi5 module is a multi-standard module with support for WLAN (802.11 a/b/g/n), Bluetooth 2.1+EDR and Bluetooth 4.0 (LE).

The module was installed on the Synapse XBRV4 host and iperf was used for streaming connection during the test. This method was approved by FCC (Tracking number 678078).

1. EUT operates as client device only with no In-service Monitoring.

## EXHIBIT 4. DECLARATION OF CONFORMITY

The EUT was found to MEET the requirements as described within the specification of FCC Title 47, CFR Part 15.407(h)(2), and Industry Canada RSS-210, Issue 8 (2010), Annex 9.

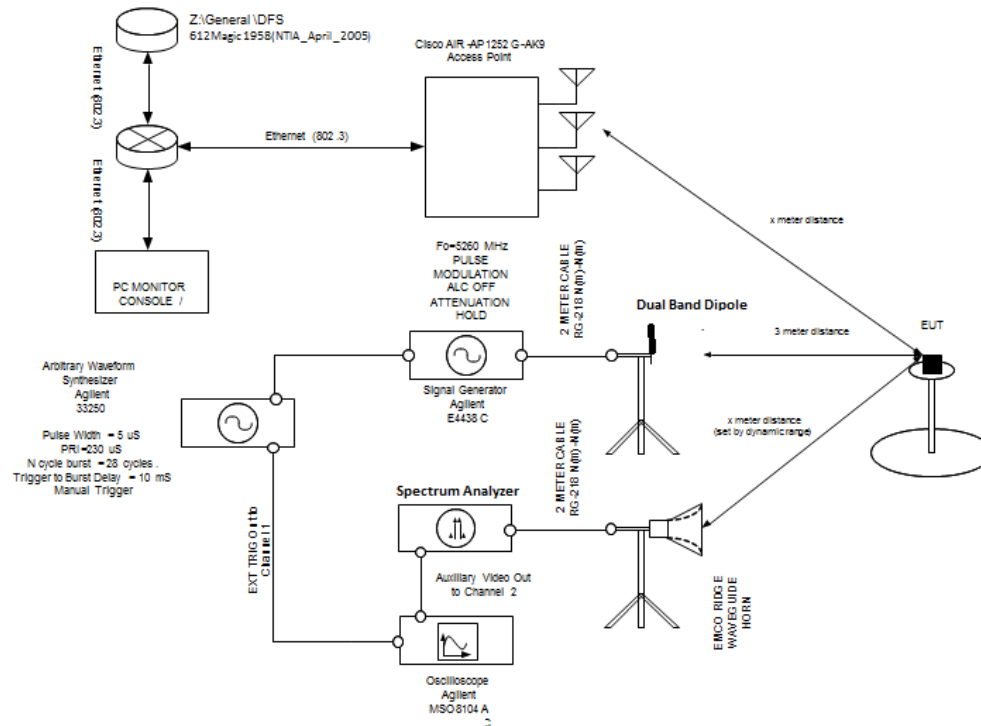

LS Research, LLC certifies that the data contained herein was taken under conditions that meet or exceed the requirements of the test specifications. The results in this Test Report apply only to the item(s) tested on the above-specified dates. Any modifications made to the EUT subsequent to the indicated test date(s) will invalidate the data herein, and void this certification.

## EXHIBIT 5. SETUP AND PROCEDURE.

### 5.1 Radiated Setup

The testing was performed in a semi-anechoic chamber. An arbitrary waveform synthesizer coupled with a signal generator was used to generate the interfering radar signal. The EUT was set at a distance of 3 meters away from the radar source and the monitoring system. The monitoring system consisted of a spectrum analyzer (centered at the frequency of interest), an oscilloscope and a receive antenna.

The event log of an approved DFS master, a CISCO AIR-AP1252AG-AK9 (FCC ID: LDK102061 and LDK 102062), was used to determine channel usage and also monitor DFS master commands to the EUT.

### 5.3 Test Procedure

The procedure referenced was **Appendix B. FCC order, ET Docket No. 03-122 (FCC 06-96)**:

The test was facilitated with the use of an approved DFS master device: A CISCO AIR-AP1252AG. The DFS mechanism of the DFS master device/AP is triggered by presenting it with a recognized radar signal type. The table below lists the approved short pulse radar test waveforms:

Radar Type	Pulse Width (μsec)	PRI (μsec)	Number of Pulses	Minimum Percentage of Successful Detection	Minimum Number of Trials
1	1	1428	18	60%	30
2	1-5	150-230	23-29	60%	30
3	6-10	200-500	16-18	60%	30
4	11-20	200-500	12-16	60%	30
Aggregate (Radar Types 1-4)				80%	120

The radar type used for this test was 28 pulses of **type 2 radar** with a pulse width of 5 microseconds and a pulse repetition interval of 230 microseconds. This waveform originates from the arbitrary waveform generator. This waveform is then fed into a signal generator operating at the desired frequency.

An FCC approved method (KDB Tracking # 678078) of alternate streaming, was utilized for a connection between the DFS master and the EUT. The event log of the DFS master was checked to determine the channel/frequency used for the link. The radar signal described above was then transmitted onto that channel.

The exchange of 802.11(h) traffic and the consequent cessation of test traffic were measured by providing auxiliary video output of a spectrum analyzer (placed into zero-span or tuned receiver mode) to a high-speed, deep memory oscilloscope.

The scope was triggered 2 seconds before the radar pulse was initiated. The radar pulses and traffic were then captured for analysis of the channel closing time and channel move time.

The falling edge of the last pulse of the radar pulse train was used as the t=0 reference for the Channel closing and channel move time.

## Exhibit 6 Channel Closing Time, Channel Move Time, Channel Non-Occupancy period

Test Engineer: Adam Alger

### 6.1 Limit

Channel move time: 10 seconds after detection

Channel closing: 200ms after detection + 60 milliseconds (aggregate) over the remaining 10 second period.

Channel non-occupancy period: 30 minutes (1800 seconds)

Figure 6.2.6 Non-occupancy scan

#### 6.2.1 Channel move time

The 20 second sweep of the event, in figure 6.2.1, confirms that traffic between the DFS master and the EUT has ceased on the original channel, 5500MHz, within the limit of 10 seconds. The 100 millisecond sweep of the same event shows the occurrence of radar pulse on the channel (yellow trace) and some traffic after.

#### 6.2.2 Channel close time

Figure 6.2.1 confirms cessation of the signal within 200ms. Based on figure 6.2.2, 6.2.3, and 6.2.4 and table 6.2.5, the aggregate of the control signals were within the 60 milliseconds limit.

#### 6.2.3 Channel non occupancy time.

Figure 6.2.6 confirms no other traffic on the channel within the 30 minute limit.
