

## MEASUREMENT REPORT

### FCC PART 22H, 24E, 27

**FCC ID:** TFJTS890G

**APPLICANT:** Uniform Industrial Corp.

**Application Type:** Certification

**Product:** Payment Terminal

**Model No.:** TS890G

**Trademark:** 

**FCC Classification:** PCB-PCS Licensed Transmitter

**FCC Rule Part(s):** Part2, Part22 Subpart H, Part24 Subpart E, Part27

**Test Procedure(s):** ANSI/TIA-603-E-2016, KDB 971168 D01v03r01

**Test Date:** September 11 ~ 18, 2018

Tested By :   
( Peter Syu )

Reviewed By :   
( Paddy Chen )

Approved By :   
( Chenz Ker )

The test results only relate to the tested sample.

This equipment has been shown to be capable of compliance with the applicable technical standards as indicated in the measurement report and was tested in accordance with the measurement procedures specified in §2.947. Test results reported herein relate only to the item(s) tested.

The test report shall not be reproduced except in full without the written approval of MRT Technology (Taiwan) Co., Ltd.

### Test Facility / Accreditations

Measurements were performed at MRT Laboratory located in Fuxing Rd., Taoyuan, Taiwan ( R.O.C )

- MRT facility is a FCC registered (Reg. No. 291082) test facility with the site description report on file and is designated by the FCC as an Accredited Test Film.
- MRT facility is an IC registered (MRT Reg. No. 21723-1) test laboratory with the site description on file at Industry Canada.
- MRT Lab is accredited to ISO 17025 by the Taiwan Accreditation Foundation (TAF Cert. No. 3261) in EMC, Telecommunications and Radio testing for FCC (Designation Number: TW3261), Industry Taiwan, EU and TELEC Rules.

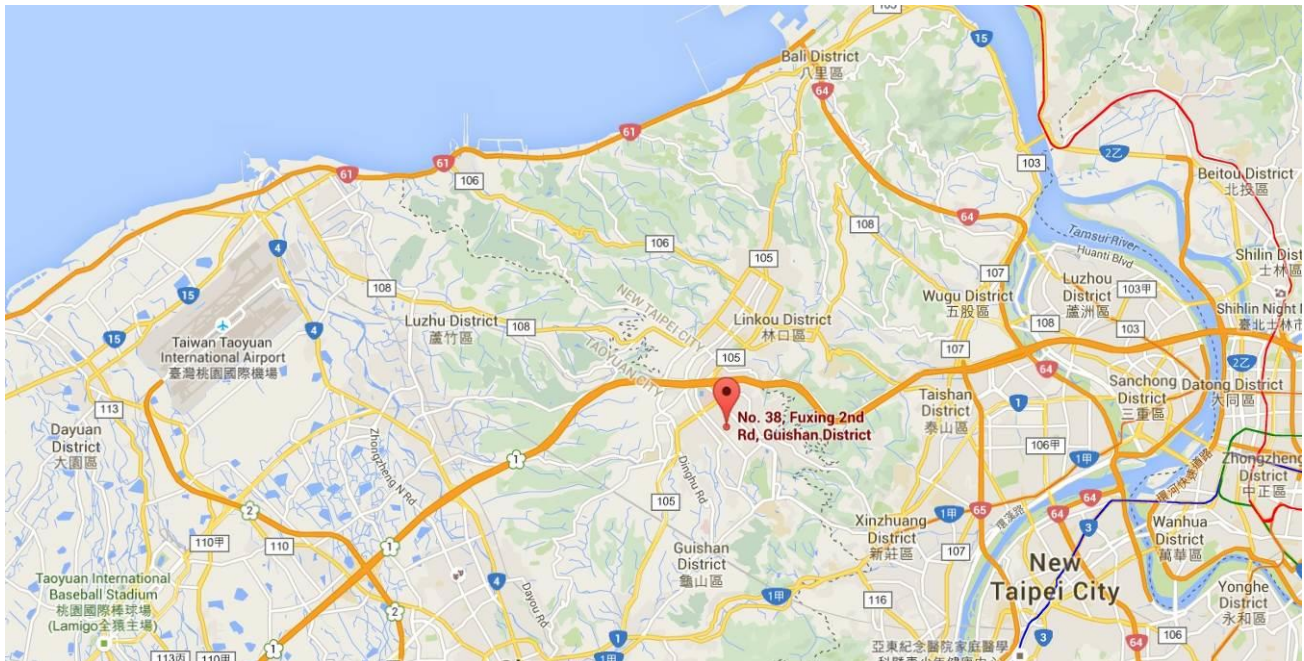

## 1. INTRODUCTION

### 1.1. Scope

Measurement and determination of electromagnetic emissions (EMC) of radio frequency devices including intentional and/or unintentional radiators for compliance with the technical rules and regulations of the Federal Communications Commission and the Industry Canada Certification and Engineering Bureau.

### 1.2. MRT Test Location

The map below shows the location of the MRT LABORATORY, its proximity to the Taoyuan City. These measurement tests were conducted at the MRT Technology (Taiwan) Co., Ltd. Facility located at No.38, Fuxing 2nd Rd., Guishan Dist., Taoyuan City 33377, Taiwan (R.O.C).

## 2. PRODUCT INFORMATION

### 2.1. Feature of Equipment under Test

Product Name	Payment Terminal
Model No.	TS890G
Trademark	
Supports Radios Spec.	3G: Band2, 4, 5 RFID: 13.56MHz
3G Operation Band (s)	Band 2, 4, 5
Frequency Range	Band2: 1850MHz~1910MHz Band4: 1710MHz~1755MHz Band5: 824MHz~849MHz
Battery (Optional)	M/N:326006100-R; 7.4V 3.4Ah/24.6Wh
Antenna Kit	M/N:YWX-6141SAHX-999 ;Type : Dipole; Gain: 2dBi
AC Adapter 1	MRF: Billion Electric Co. Ltd. Model No: BA048-090500MCX Input: AC 100-240V~1.5A, 50-60Hz Output: DC 9V, 5.0A DC Cable Out Non-Shielding, 1.5m
AC Adapter 2	MRF: Powertron Electronics Corp. Model No: PA 1065-090T2B600 Input: AC 100-240V~1.5A, 50-60Hz Output: DC 9V, 6.0A DC Cable Out Non-Shielding, 1.5m with core*1

Note: There're two types of this product. The differences of these two types are as below, the RF hardware are identical.

Model	Battery	Adapter	Ethernet	Modem Port	RS232 Port
TS890G	X	O	O	O	O
TS890G (Optional)	O	O	X	X	X

## 2.2. Device Capabilities

This device contains the following capabilities:

WCDMA Band 2, 4, 5

## 2.3. Test Configuration

The **Payment Terminal** was tested per the guidance of ANSI/TIA-603-E-2016 and KDB 971168 D01v03r01. See section 3.0 of this report for a description of the radiated and antenna port conducted emissions tests.

## 2.4. EMI Suppression Device(s)/Modifications

No EMI suppression device(s) were added and no modifications were made during testing.

### 3. DESCRIPTION OF TEST

#### 3.1. Evaluation Procedure

The measurement procedures described in the “Land Mobile FM or PM – Communications Equipment – Measurements and Performance Standards” (ANSI/TIA-603-E-2016) and “Procedures for Compliance Measurement of the Fundamental Emission Power of Licensed Wideband (> 1 MHz) Digital Transmission Systems” (KDB 971168) were used in the measurement of the **Payment Terminal**

Deviation from measurement procedure.....None

#### 3.2. Cellular – Base Frequency Blocks

**\$22.905**

#### 3.3. Cellular – Mobile Frequency Blocks

**\$22.905**

### 3.4. PCS – Base Frequency Blocks

#### §24.229

### 3.5. PCS – Mobile Frequency Blocks

#### §24.229

### **3.6. Occupied Bandwidth**

#### **§2.1049 §22.917(b) §24.238(b) §27.53(g)**

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured. The spectrum analyzers' "occupied bandwidth" measurement function was used to record the occupied bandwidth in accordance with KDB 971168.

### **3.7. Spurious and Harmonic Emissions at Antenna Terminal**

#### **§2.1051 §22.917(a) §24.238(a) §27.53(h)**

The level of the carrier and the various conducted spurious and harmonic frequencies is measured by means of a calibrated spectrum analyzer. The spectrum is scanned from the lowest frequency generated in the equipment up to a frequency including its 10<sup>th</sup> harmonic. On any frequency outside a licensee's frequency block, the power of any emission shall be attenuated below the transmitter power (P) by at least  $43 + 10 \log(P)$  dB. Compliance with these provisions is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kHz or greater for Part 22. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emission are attenuated at least 26 dB below the transmitter power.

### 3.8. Power and Radiated Spurious Emissions

#### §2.1053 §22.913(a.2) §22.917(a) §24.232(c) §24.238(a) §27.53(h)

The radiated test facilities consisted of an indoor 3 meter semi-anechoic chamber used for final measurement and exploratory measurements, when necessary. The measurement area is contained within the semi-anechoic chamber which is shielded from any ambient interference. For measurements above 1GHz absorbers are arranged on the floor between the turn table and the antenna mast in such a way so as to maximize the reduction of reflections. For measurements below 1GHz, the absorbers are removed. A MF Model 210SS turntable is used for radiated measurement. It is a continuously rotatable, remote-controlled, metallic turntable and 2 meters (6.56 ft.) in diameter. The turn table is flush with the raised floor of the chamber in order to maintain its function as a ground plane. A 80cm high PVC support structure is placed on top of the turntable.

The equipment under test was transmitting while connected to its integral antenna and is placed on a wooden turntable 80cm above the ground plane and 3 meters from the receive antenna. The receive antenna height is adjusted between 1 and 4 meter height, the turntable is rotated through 360 degrees, and the EUT is manipulated through all orthogonal planes representative of its typical use to achieve the highest reading on the receive spectrum analyzer. Radiated power levels are also investigated with the receive antenna horizontally and vertically polarized. The maximized power level is recorded using the spectrum analyzer "Channel Power" function with the integration band set to the emissions' occupied bandwidth, a RMS detector, RBW = 100kHz, VBW = 300kHz, and a 1 second sweep time over a minimum of 10 sweeps, per the guidelines of KDB 971168.

Per the guidance of ANSI/TIA-603-E-2016, a half-wave dipole is then substituted in place of the EUT. For emissions above 1GHz, a horn antenna is substituted in place of the EUT. The substitute antenna is driven by a signal generator with the level of the signal generator being adjusted to obtain the same receive spectrum analyzer level previously recorded from the spurious emission from the EUT. The power of the emission is calculated using the following formula:

$$P_d [\text{dBm}] = P_g [\text{dBm}] - \text{cable loss} [\text{dB}] + \text{antenna gain} [\text{dBd/dBi}]$$

Where,  $P_d$  is the dipole equivalent power,  $P_g$  is the generator output into the substitution antenna, and the antenna gain is the gain of the substitute antenna used relative to either a half-wave dipole (dBd) or an isotropic source (dBi). The substitute level is equal to  $P_g [\text{dBm}] - \text{cable loss} [\text{dB}]$ .

The calculated  $P_d$  levels are then compared to the absolute spurious emission limit of -13dBm which is equivalent to the required minimum attenuation of  $43 + 10 \cdot \log_{10}(\text{Power} [\text{Watts}])$  specified in 22.917(a).

### 3.9. Peak-Average Ratio

#### §24.232(d)

A peak to average ratio measurement is performed at the conducted port of the EUT. The spectrum analyzers Complementary Cumulative Distribution Function (CCDF) measurement profile is used to determine the largest deviation between the average and the peak power of the EUT in a given bandwidth. The CCDF curve shows how much time the peak waveform spends at or above a given average power level. The percent of time the signal spends at or above the level defines the probability for that particular power level.

For pulsed signals, the spectrum analyzer is set to use an internal “RF Burst” trigger that is synced with an incoming pulse and the measurement interval is set to less than the duration of the “on time” of one burst to ensure that energy is only captured during a time in which the transmitter is operating at maximum power. For continuous signals, the trigger is set to “free run” in the CCDF measurement mode.

### 3.10. Frequency Stability / Temperature Variation

#### §2.1055 §22.355 §22.863 §22.905 §24.229 §24.235 §27.54

Frequency stability testing is performed in accordance with the guidelines of ANSI/TIA-603-E-2016.

The frequency stability of the transmitter is measured by:

- a.) Temperature: The temperature is varied from -30°C to +50°C in 10°C increments using an environmental chamber.
- b.) Primary Supply Voltage: The primary supply voltage is varied from 85% to 115% of the nominal value for non hand-carried battery and AC powered equipment. For hand-carried, battery-powered equipment, primary supply voltage is reduced to the battery operating end point which shall be specified by the manufacturer.

Specification – For Part 22, the frequency stability of the transmitter shall be maintained within  $\pm 0.00025\%$  ( $\pm 2.5$  ppm) of the center frequency.

Time Period and Procedure:

1. The carrier frequency of the transmitter is measured at room temperature (20°C to provide a reference).
2. The equipment is turned on in a “standby” condition for fifteen minutes before applying power to the transmitter. Measurement of the carrier frequency of the transmitter is made within one minute after applying power to the transmitter.
3. Frequency measurements are made at 10°C intervals ranging from -30°C to +50°C. A period of at least one half-hour is provided to allow stabilization of the equipment at each temperature level.

#### 4. TEST EQUIPMENT CALIBRATION DATE

##### Conducted Emissions – SR2

Instrument	Manufacturer	Type No.	Asset No.	Cali. Interval	Cali. Due Date

## 5. SAMPLE CALCULATIONS

### **GSM Emission Designator**

Emission Designator = 250KGXW

GSM BW = 250 kHz

G = Phase Modulation

X = Cases not otherwise covered

W = Combination (Audio/Data)

### **EGPRS Emission Designator**

Emission Designator = 250KG7W

GSM BW = 250 kHz

G = Phase Modulation

7 = Quantized/Digital Info

W = Combination (Audio/Data)

### **CDMA Emission Designator**

Emission Designator = 1M25F9W

WCDMA BW = 1.25 MHz

F = Frequency Modulation

9 = Composite Digital Info

W = Combination (Audio/Data)

### **WCDMA Emission Designator**

Emission Designator = 5M00F9W

WCDMA BW = 5.00 MHz

F = Frequency Modulation

9 = Composite Digital Info

W = Combination (Audio/Data)

### **Spurious Radiated Emission**

Example: Spurious emission at 1688.10 MHz

The receive spectrum analyzer reading at 3 meters with the EUT on the turntable was  $-65.0\text{dBm}$ . The gain of the substituted antenna is  $6.5\text{dBi}$ . The signal generator connected to the substituted antenna terminals is adjusted to produce a reading of  $-65.0\text{dBm}$  on the spectrum analyzer. The loss of the cable between the signal generator and the terminals of the substituted antenna is  $4.5\text{ dB}$  at  $1688.1\text{MHz}$ . So  $2\text{ dB}$  is added to the signal generator reading of  $-25\text{dBm}$  yielding  $-23\text{dBm}$ . The fundamental EIRP was  $24.0\text{dBm}$  so this harmonic was  $24.0\text{dBm} - (-23) = 47\text{dBc}$ .

## 6. MEASUREMENT UNCERTAINTY

Where relevant, the following test uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of  $k = 2$ .

Radiated Emission Measurement - AC1
Measuring Uncertainty for a Level of Confidence of 95% ( $U=2Uc(y)$ ): 4.22dB

## 7. TEST RESULT

### 7.1. Summary

**Company Name:** Uniform Industrial Corp.  
**FCC Classification:** PCS Licensed Transmitter (PCB)

2.1055 22.355 24.235 27.54	Frequency Stability	$< 2.5 \text{ ppm}$		Pass	Section 7.7

**Notes:**

- 1) All modes of operation and data rates were investigated. The test results shown in the following sections represent the worst case emissions.
- 2) All antenna port conducted emissions testing was performed on a test bench with the antenna port of the EUT connected to the spectrum analyzer through calibrated cables, attenuators, and couplers.

## 7.2. Occupied Bandwidth

### 7.2.1. Test Limit

N/A

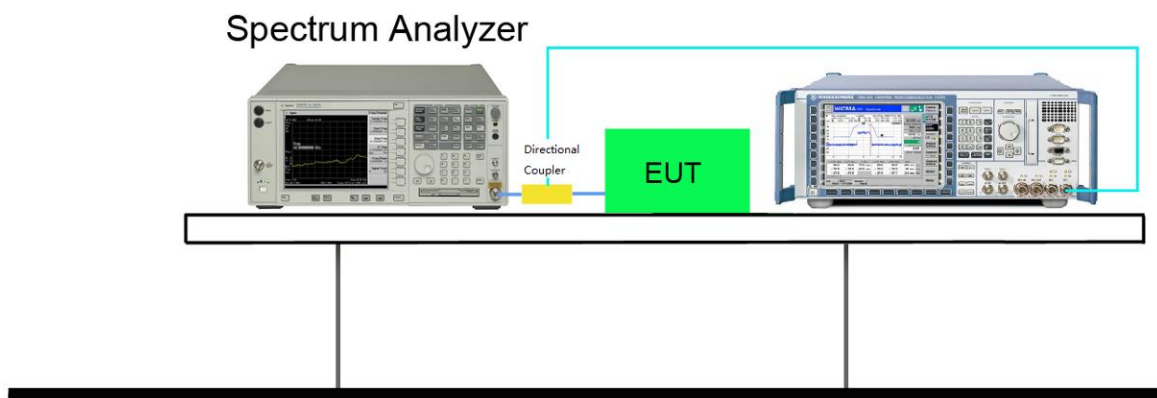

### 7.2.2. Test Procedure used

KDB 971168 D01v03r01 – Section 4.2 & ANSI/TIA-603-E-2016

### 7.2.3. Test Setting

1. The spectrum analyzer center frequency is set to the nominal EUT channel center frequency.  
The span range for the spectrum analyzer shall be between two and five times the anticipated OBW.
2. The nominal resolution bandwidth (RBW) shall be in the range of 1 to 5 % of the anticipated OBW, and the VBW shall be at least 3 times the RBW. (RBW = approximately 1% of the emission bandwidth).
3. Set the detection mode to peak, and the trace mode to max hold.
4. Use the 99 % power bandwidth function of the spectrum analyzer (if available) and report the measured bandwidth.

### 7.2.4. Test Setup

### 7.2.5. Test Result

Test Mode	Channel No.	Frequency (MHz)	99% Occupied Bandwidth (kHz)	-26dB Occupied Bandwidth (kHz)	Result
WCDMA Band2 1900	9262	1852.4	4066.6	4623	Pass
	9400	1880	4071.2	4623	Pass
	9538	1907.6	4073.2	4646	Pass

## 7.4. Band Edge at Antenna Terminal

### 7.4.1. Test Limit

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least  $43 + 10\log(P)$  dB.

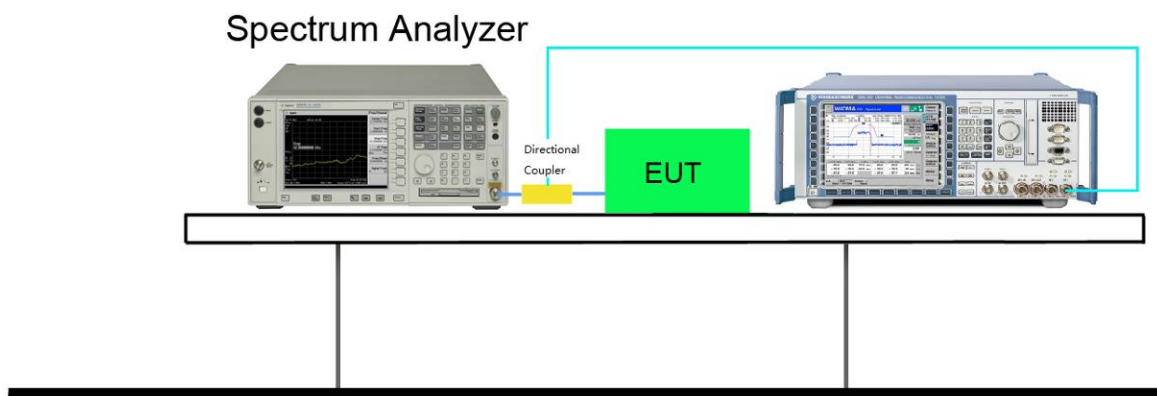

### 7.4.2. Test Procedure Used

KDB 971168 D01v03r01 – Section 6.0 & ANSI/TIA-603-E-2016

### 7.4.3. Test Setting

In the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (i.e. 100 kHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

### 7.4.4. Test Setup

#### 7.4.5. Test Result

Mode	Channel No.	Frequency (MHz)	Modulation	Test Result
WCDMA Band2 1900	9262	1852.4	QPSK	Pass
	9538	1907.6	QPSK	Pass
WCDMA Band4 1700	1312	1712.4	QPSK	Pass

## **7.5. Power and Radiated Spurious Emissions**

### **7.5.1 Test Limit**

#### **Radiated Power**

For FCC Part 22.913(a)(2):

The ERP of mobile transmitters and auxiliary test transmitters must not exceed 7 Watts.

#### **Radiated Spurious Emissions**

The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least  $43 + 10\log(P)$  dB.

### **7.5.2 Test Procedure Used**

KDB 971168 D01v03r01 - Section 7.0 & ANSI/TIA-603-E-2016

### **7.5.3 Test Setting**

1. The EUT shall be placed at the specified height on a support, and in the position closest to normal use as declared by provider.
2. The test antenna shall be oriented initially for vertical polarization and shall be chosen to correspond to the frequency of the transmitter
3. The output of the test antenna shall be connected to the measuring receiver.
4. The transmitter shall be switched on and the measuring receiver shall be tuned to the frequency of the transmitter under test.
5. The test antenna shall be raised and lowered through the specified range of height until a maximum signal level is detected by the measuring receiver.
6. The transmitter shall then be rotated through  $360^\circ$  in the horizontal plane, until the maximum signal level is detected by the measuring receiver.
7. The test antenna shall be raised and lowered again through the specified range of height

until a maximum signal level is detected by the measuring receiver.

8. The maximum signal level detected by the measuring receiver shall be noted.
9. The transmitter shall be replaced by a substitution antenna.
10. The substitution antenna shall be orientated for vertical polarization and the length of the substitution antenna shall be adjusted to correspond to the frequency of the transmitter.
11. The substitution antenna shall be connected to a calibrated signal generator.
12. If necessary, the input attenuator setting of the measuring receiver shall be adjusted in order to increase the sensitivity of the measuring receiver.
13. The test antenna shall be raised and lowered through the specified range of height to ensure that the maximum signal is received.
14. The input signal to the substitution antenna shall be adjusted to the level that produces a level detected by the measuring receiver, that is equal to the level noted while the transmitter radiated power was measured, corrected for the change of input attenuator setting of the measuring receiver.
15. The measurement shall be repeated with the test antenna and the substitution antenna orientated for horizontal polarization.
16. The measure of the effective radiated power is the larger of the two levels recorded at the input to the substitution antenna, corrected for gain of the substitution antenna if necessary.
17. Test site anechoic chamber refer to ANSI C63.4: 2014.

Voltage vs. Frequency Stability						
Voltage (%)	Power (VAC)	Temp (°C)	Declared Frequency (MHz)	Measured Frequency (Hz)	Frequency Tolerance (ppm)	Limit (ppm)
100%	120V/60Hz	20	1732.6	-16.67	0.010	2.5
115%	138V/60Hz	20	1732.6	-19.76	0.011	2.5
85%	102V/60Hz	20	1732.6	-22.36	0.013	2.5

Operating Frequency	836.6MHz
Channel	CH4183
Test Mode	WCDMA Band 5
Reference Voltage	AC 12V/60Hz

Temperature vs. Frequency Stability
