WMM and WPA are the registered trademarks of Wi-Fi Alliance. All other brand and product names are trademarks or registered trademarks of their respective owners.

Notice: Copyrights © 2009 by Compex, Inc. All rights reserved. Reproduction, adaptation, or translation without prior permission of Compex, Inc. is prohibited, except as allowed under the copyright laws.

### ***Disclaimer***

Compex, Inc. provides this manual without warranty of any kind, expressed or implied, including but not limited to the implied warranties of merchantability and fitness for a particular purpose. Compex, Inc. may make improvements and/or changes to the product and/or specifications of the product described in this manual, without prior notice. Compex, Inc will not be liable for any technical inaccuracies or typographical errors found in this guide. Changes are periodically made to the information contained herein and will be incorporated into later versions of the manual. The information contained is subject to change without prior notice.

## **FCC NOTICE**

This device has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This device generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this device does cause harmful interference to radio or television reception, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Connect the computer to an outlet on a circuit different from that to which the receiver is connected.
- Increase the separation between the computer and receiver.
- Consult the dealer or an experienced radio/TV technician for help.

**Caution:** Any changes or modifications not expressly approved by the grantee of this device could void the user's authority to operate the equipment.

**FCC Compliance Statement:** This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions:

This device may not cause harmful interference, and

This device must accept any interference received, including interference that may cause undesired operation.

## **RF Exposure warning**

The equipment complies with FCC/IC RF exposure limits set forth for an uncontrolled environment. The equipment must be installed to provided a separation distance of at least 20cm from all persons and must not be co-located or operating in conjunction with any other antenna or transmitter.

## **ICES 003 Statement**

This Class B digital apparatus complies with Canadian ICES-003.

This device complies with RSS-Gen of the IC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

Under Industry Canada regulations, this radio transmitter may only operate using an Integral Antenna and maximum 2 dBi gain approved for the transmitter by Industry Canada. To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that necessary for successful communication.

## **Declaration of Conformity**

Compex, Inc. declares the following:

Product Name: Wireless Access Point with PoE

Model No.: WPE72NX conforms to the following Product Standards:

This device complies with the Electromagnetic Compatibility Directive (89/336/EEC) issued by the Commission of the European Community. Compliance with this directive implies conformity to the following European Norms (in brackets are the equivalent international standards.)

**Electromagnetic Interference (Conduction and Radiation):** EN 55022 (CISPR 22)

**Electromagnetic Immunity:** EN 55024 (IEC61000-4-2, 3, 4, 5, 6, 8, 11)

**Low Voltage Directive:** EN 60 950: 1992+A1: 1993+A2: 1993+A3: 1995+A4: 1996+A11: 1997.

*Therefore, this product is in conformity with the following regional standards: FCC Class B:*

following the provisions of FCC Part 15B, FCC Part 15.247, FCC Part 15.407 and KDB848637.

**CE Mark:** following the provisions of the EC directive.

Compex, Inc. also declares that:

The wireless card in this product complies with the R&TTE Directive (1999/5/EC) issued by the Commission of the European Community. Compliance with this directive implies conformity to the following:

**EMC Standards:** FCC: 47 CFR Part 15, Subpart B, 47 CFR Part 15, Subpart C (Section 15.247), 47 CFR Part E (Section 15.407) and KDB848637; CE: EN 300 328, EN 301 893, EN 301 489-17.

*Therefore, this product is in conformity with the following regional standards: FCC Class B:*

following the provisions of FCC Part 15 directive, **CE Mark:** following the provisions of the EC directive.

Manual Version:1.0.1c (May 2011)

This manual is written based on Firmware version 2.26

# Overview the Product

## Introduction

The high-performance Wireless Network Access Point (AP) is designed for enterprise and public access applications. Embedded with the Atheros chipset, it boasts network robustness, stability and wider network coverage. Based on 802.11n (Draft 2.0), the access point supports high-speed data transmission of up to 300Mbps.

The access point is capable of operating in different modes, which makes it suitable for a wide variety of wireless applications, including long-distance deployments.

Designed with two external reverse SMA connectors offering excellent electrical performance and compatible with reverse SMA antennas, the access point can be used for a wide variety of wireless applications and allows you to position the wireless antenna in a better signal-broadcasting location for improved wireless coverage and signal strength or simply in a more convenient location. FCC REQUIREMENTS: THIS DEVICE IS RESTRICTED TO INDOOR USE ONLY

To protect your security and privacy, the access point is armed with many enhanced and latest wireless security features such as IEEE 802.11i standards, MAC Address Filtering, IEEE 802.1x Authentication and 64/128-bit WEP (Wired Equivalent Privacy) to ensure privacy for the heterogeneous mix of users within the same wireless network.

# Features and Benefits

## Virtual AP (Multiple SSID)

Virtual AP implements mSSID (Multi-SSID) This allows a single wireless card to be set up with multiple virtual AP connections with different SSIDs or BSSID (Basic Service Set Identifier) and security modes.

## Highly Secured Wireless Network

The access point supports the highest available wireless security standard: IEEE802.11i compliant. The access point also supports IEEE 802.1x for secure and centralized user-based authentication. Wireless clients are thus required to authenticate through highly secure methods like EAP-TTLS and EAP-PEAP, in order to obtain access to the network.

## uConfig Utility

The exclusive uConfig utility allows users to access the user-friendly Web configuration interface of the access point without having to change the TCP/IP setup of the workstation.

## HTTPS

The access point supports HTTPS (SSL) in addition to the standard HTTP. HTTPS (SSL) features additional authentication and encryption for secure communication.

## Telnet

Telnet allows a computer to remotely connect to the access point CLI (Command Line Interface) for control and monitoring.

## SSH

SSH (Secure Shell Host) establishes a secure host connection to the access point CLI for control and monitoring.

## Operation Modes and Connection Examples

### Access Point Mode

The Access Point Mode is the default mode of the device. It enables the bridging of wireless clients to wired network infrastructure.

The illustration below shows a typical resources sharing application example using this device. The wireless users are able to access the file server connected to the switch, through the access point in Access Point Mode.

## **Station Mode**

In **Station** mode the device acts as a wireless client.

When connected to an access point, it creates a network link between the Ethernet network connected at this client device, and the wireless Ethernet network connected at the access point.

In this example the workgroup PCs on the ethernet network connected to the Station device can access the printer across the wireless connection to the access point where the printer is connected.

## Router Mode

In Router Mode, the device also operates as a router.

Either the wireless or Ethernet can be setup as WAN connection to a broadband modem. Wireless as WAN is known as **Station + Router mode** (or **Wireless Routing Client mode**) and Ethernet as WAN is known as **AP + Router mode** (or **Gateway mode**). Device supports several types of broadband connections Static IP, Dynamic IP and PPPoE. For setup details refer to the respective section.

The illustration below shows the Ethernet port is setup as the WAN port and the wireless connection as the LAN.

### Station + Router connection example

Wireless is use to connect to the broadband.

Ethernet is the local network (LAN)

sharing the broadband connection.

### AP + Router connection example

Ethernet is use to connect to the broadband.

Wireless is the local network (LAN)

sharing the broadband connection.

Broadband Internet Access Type:

#### Static IP Address

Use Static IP Address you have subscribed a fixed IP or range IP addresses from your ISP.

#### Dynamic IP Address

With Dynamic IP Address the device automatically request IP address from modem or ISP.

#### PPP over Ethernet (PPPoE)

When using ADSL services provided by your ISP support PPPoE connection.

# Panel Views and Description

	Features	Status and Indications
1	Diagnostic LED	Flashing during power-up. Off device is ready..
2	Signal Strength level Indicator	(low) (higher low) (lower high) (high) LED10 LED20 LED30 LED40 
3	Ethernet Port LED	Steady ON: Connection is established. OFF: No network connection
4	Power LED	Static Light: Power is being supplied to the device. Off: Power is not being supplied to the device.
5	Reset Button	<ul style="list-style-type: none"> <li>To reboot, press once.</li> <li>To reset password, press and hold the button for 5 seconds before releasing it.</li> <li>To restore the factory default settings, press and hold the button for 8 seconds before releasing it</li> </ul>
6	Ethernet Port	10/100Mbps Ethernet port PoE input : 5V – 24V DC

7	DC Jack	Range : 5V- 24V DC
8	Antenna	External SMA Antenna

## Install the Hardware

### Hardware Setup

- CAT5/5e Networking Cable.
- At least 1 computer installed with a web browser and a wired or wireless network interface adapter.
- All network nodes installed with TCP/IP and properly configured IP address parameters.

### Using power adapter to power up the device

Step 1:

Insert one end of the Ethernet cable to the Ethernet port on your access point, and the other end of the cable to your PC's Ethernet network adapter.

**Step 2:**

Attach the power adapter to the main electrical supply, and connect the power plug into the socket of the access point.

**Step 3:**

Turn ON the power supply and power ON your PC. Notice that the LEDs: Power and Port have lighted up. This indicates that connection has been established successfully between your access point and your PC.

## Using PoE+ to power up the device

The access point is fully compatible with PoE+. This accessory supplies operational power to the wireless AP via the Ethernet cable connection.

Users who have already purchased PoE+ and who wish to use it to supply power to the access point may follow the installation procedures shown below:

### Step 1:

Use an RJ45 Ethernet cable to connect one end of the cable to the LAN OUT port of PoE+ and the other end to Ethernet port of the access point.

### Step 2:

Next, connect the RJ45 Ethernet cable attached to PoE+ to your PC's Ethernet network adapter.

Once you have finished configuring your access point, you can connect the PoE+'s RJ45 Ethernet cable to your network device, such as to a switch or hub.

### Step 3:

Connect the power adapter supplied with PoE+ to the main electrical supply and the power plug into the socket of the injector.

### Note:

The voltage and current supplied to the power adapter and the PoE+ power adapter are different. Do not interchange the power adapters.

### Step 4:

Turn on your power supply. Notice that the **Power** LED has lighted up. This indicates that the access point is receiving power through PoE+. Notice also that the corresponding port LEDs have lighted up. This indicates that connection between your access point and your PC has been established.

## Configure the IP Address

After setting up the hardware you need to assign an IP address to your PC so that it is in the same subnet as the access point.

### For Windows 95/98/98SE/ME/NT

#### Step 1:

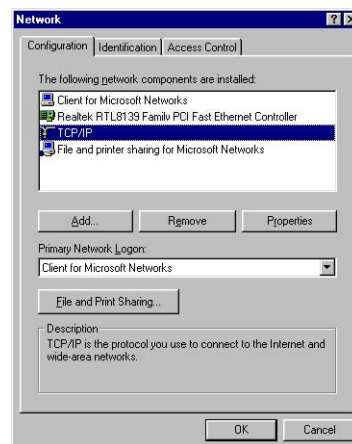

From your desktop, right-click the **Network Neighborhood** icon and select **Properties**.

#### Step 2:

Select the network adapter that you are using, then right-click and select **Properties**.

#### Step 3:

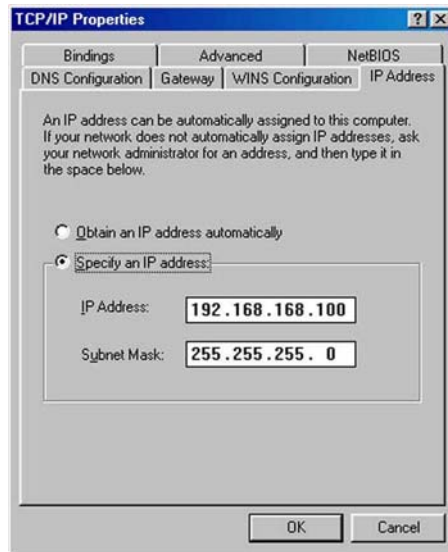

Highlight **TCP/IP** and click on the **Properties** button.

#### Step 4:

Select the **Specify an IP address** radio button.

Set the IP address to 192.168.168.X and subnet mask to 255.255.255.0, where X can be any number from 2 to 254.

#### Step 5:

To verify that the IP address has been correctly assigned to your PC, go to the **Start** menu, select **Run**, and enter the command: *winipcfg*.

Select the Ethernet adapter from the drop-down list and click **OK**.

PC is now setup with a proper IP address to communicate with the access point.

## For Windows XP/2000

Step 1:

Go to your desktop, right-click on the **My Network Places** icon and select **Properties**.

Step 2:

Right-click the network adapter icon and select **Properties**.

Step 3:

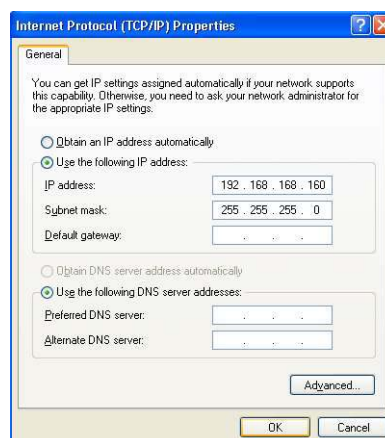

Highlight **Internet Protocol (TCP/IP)** and click on the **Properties** button.

Step 4:

Select the **Use the following IP address** radio button.

Set the IP address to 192.168.168.X and subnet mask to 255.255.255.0, where X can be any number from 2 to 254.

Step 5:

Click on the **OK** button to close all windows.

Step 6:

To verify that the IP address has been correctly assigned to your PC, go to the **Start** menu, **Accessories**, select **Command Prompt**, and type the command: *ipconfig/all*

```
C:\WINDOWS\system32\cmd.exe
C:\Documents and Settings\Administrator>ipconfig/all

Windows IP Configuration

Host Name . . . . . : winxp-0rlrvt3pj
Primary Dns Suffix . . . . . :
Node Type . . . . . : Unknown
IP Routing Enabled. . . . . : No
WINS Proxy Enabled. . . . . : No

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . :
    Description . . . . . : Realtek RTL8139 Family PCI Fast Ethernet NIC
    Physical Address. . . . . : 00-01-80-0E-86-37
    Dhcp Enabled. . . . . : No
    IP Address. . . . . : 192.168.168.22
    Subnet Mask . . . . . : 255.255.255.0
    IP Address. . . . . : 192.168.88.43
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.88.2
    DNS Servers . . . . . : 165.21.100.88
                           165.21.83.88
```

PC is now setup with a proper IP address to communicate with the access point.

# Access the Web Interface

## Access with uConfig

The UConfig utility provides direct access to the web interface.

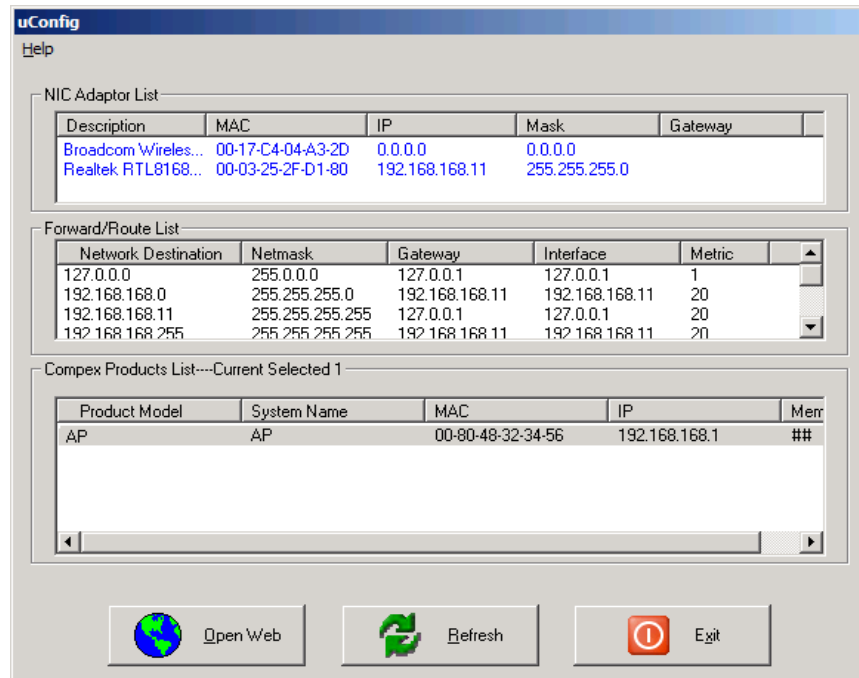

Step 1:

Click **uConfig** icon to launch the utility then click **Yes** button.

## Step 2:

Select the access point from the products list and click on the **Open Web** button. To retrieve and display the latest device(s) in the list, click on the **Refresh** button.

## Step 3:

Do not exit the uConfig program while accessing the web-based interface as this will disconnect you from the device. Click on the **OK** button.

Step 4:

At the login prompt, enter the User Name and Password.

The default are :

User Name : **admin**

Password : **password**

A screenshot of a web browser dialog box titled "Authentication Required". The dialog contains a question mark icon and the text: "A username and password are being requested by http://192.168.68.3. The site says: 'Wireless-N'". Below this text are two input fields: "User Name:" and "Password:". At the bottom of the dialog are two buttons: "OK" and "Cancel".

Step 5:

It then opens the device home page. The Status page.

A screenshot of the device's status page. The page has a navigation bar at the top with the following tabs: STATUS, BASIC WIRELESS, BASIC NETWORK, ADVANCED WIRELESS, ADVANCED NETWORK, VLAN, SERVICES, and SYSTEM. The main content area is divided into several sections:

- MAIN**: Uptime: 0 Days 00:02:58; Host Name: AP; System Time: 01/01/2000 00:02:59.
- VERSION**: FIRMWARE VERSION: 2.11 (build 100428); LOADER VERSION: 2.56 (build 0612).
- LAN SETTING**: LAN MAC: 00-80-48-6a-e0-c4; MODE: static; IP ADDRESS: 192.168.168.1; GATEWAY IP ADDRESS: ; Pri.DNS IP: ; Sec.DNS IP: ; LAN cable: Plugged.
- WAN SETTING**: WAN MAC: Not Available; MODE: Not Available; IP ADDRESS: Not Available; GATEWAY IP ADDRESS: Not Available; Pri.DNS IP: Not Available; Sec.DNS IP: Not Available.
- Radio 1**: Wireless Mode: Access Point; LOCAL AP SSID: Mimo-Series-1; Frequency: 5.54 GHz; Ack Timeout: 27; MAC: 00-80-48-6a-e0-c5; LOCAL AP MAC: 00-80-48-6a-e0-c5; Security: None; Refresh button.
- CONNECTED STATIONS (0)**: A table with columns: MAC ADDRESS, SIGNAL STRENGTH, Tx RATE, Tx ECQ, Rx RATE, CHANNEL WIDTH.
- LOCAL AP STATISTICS**: Received: 0 Bytes, 0 Packets, 0 Errors; Transmitted: 0 Bytes, 0 Packets, 0 Errors.
- LOCAL AP ERRORS**: RX Invalid NWID: 106; TX Excessive Retries: 0; RX Invalid Crypt: 0; Missed Beacons: 0; RX Invalid Frag: 0; Other Errors: 0; Select VAP dropdown.

## Access with Web Browser

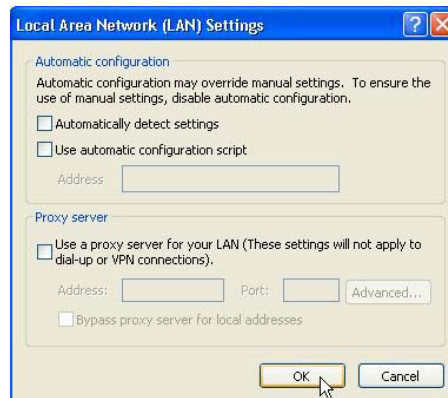

### Step 1:

Launch your Web browser, e.g. Internet Explorer, FireFox, Netscape, etc.  
If using MS IE, under the **Tools** tab, select **Internet Options**.

### Step 2:

Open the **Connections** tab and in the **LAN Settings** section disable all the option boxes. Click on the **OK** button to update the changes.

### Step 3:

At the **Address** bar type in `http://192.168.168.1` and press **Enter** on your keyboard.

Step 4:

At the login prompt, enter the User Name and Password.

The default are :

User Name : admin

Password : password

The image shows a dialog box titled "Authentication Required" with a question mark icon. The message reads: "A username and password are being requested by http://192.168.68.3. The site says: 'Wireless-N'". Below the message are two input fields: "User Name:" and "Password:". At the bottom of the dialog are two buttons: "OK" and "Cancel".

It then opens the device home page. The Status page.

The image shows the device's status page. At the top left is the COMPEX logo. A navigation menu includes: STATUS, BASIC WIRELESS, BASIC NETWORK, ADVANCED WIRELESS, ADVANCED NETWORK, VLAN, SERVICES, and SYSTEM. The "STATUS" page is active, showing a "More Status" dropdown menu. The page is divided into several sections:

- MAIN:** Uptime: 0 Days 00:02:58; Host Name: AP; System Time: 01/01/2000 00:02:59.
- VERSION:** FIRMWARE VERSION: 2.11 (build 100428); LOADER VERSION: 2.56 (build 0612).
- LAN SETTING:** LAN MAC: 00-80-48-6a-e0-c4; MODE: static; IP ADDRESS: 192.168.168.1; GATEWAY IP ADDRESS: ; Pri.DNS IP: ; Sec.DNS IP: ; LAN cable: Plugged.
- WAN SETTING:** WAN MAC: Not Available; MODE: Not Available; IP ADDRESS: Not Available; GATEWAY IP ADDRESS: Not Available; Pri.DNS IP: Not Available; Sec.DNS IP: Not Available.
- Radio 1:** Wireless Mode: Access Point; LOCAL AP SSID: Nimo-Series-1; Frequency: 5.54 GHz; Ack Timeout: 27; MAC: 00-80-48-6a-e0-c5; LOCAL AP MAC: 00-80-48-6a-e0-c5; Security: None; Refresh button.
- CONNECTED STATIONS (0):** Table with columns: MAC ADDRESS, SIGNAL STRENGTH, Tx RATE, Tx CCQ, Rx RATE, CHANNEL WIDTH.
- LOCAL AP STATISTICS:** Received: 0 Bytes, 0 Packets, 0 Errors; Transmitted: 0 Bytes, 0 Packets, 0 Errors.
- LOCAL AP ERRORS:** RX Invalid NWID: 106; TX Excessive Retries: 0; RX Invalid Crypt: 0; Missed Beacons: 0; RX Invalid Frag: 0; Other Errors: 0; Select VAP dropdown.

# Navigation

## Main Menu Bar

- Status :** Page displays current status of the device and the statistical information.
- Basic Wireless :** Page contains the controls for a wireless network configuration, while covering basic wireless settings which define operating mode, associating details and data security options.
- Basic Network :** Page covers the configuration of network operating mode, IP settings and network services (i.e. DHCP Server).
- Advanced Wireless :** Page settings for advanced wireless features.  
Advanced Network page settings for more details of these features.
- Services :** Page covers the configuration of system management services (i.e. Ping Watchdog, Auto-Reboot, SNMP, NTP, Telnet, SSH, System Log).
- System :** Page contains controls for system maintenance routines, administrator account management, device customization and configuration backup.
- Activation Keys :** Optional special add-on functions you can purchased separately to activate in device.

## How to save changes.

After made changes from each respective setup page, click this button,  Next the prompt below appear. You are asked to confirm if you want to save the change permanently to device flash.

Click **Save** will write all configuration changes to flash.  
Click **Discard** will discard all changes made.  
If not sure what changes were made earlier, recommend to discard and reconfigure again.

# Basic Network Tab

Click **BASIC NETWORK** from the menu bar to open the page as show below.

**NETWORK INFORMATION**

Network Mode:  (Dropdown menu showing Bridge, Router, Bridge)

**LOCAL AREA NETWORK**

LAN Mode:  DHCP Client  Static

IP Address:

Netmask:

Gateway IP:

Primary DNS IP:

Secondary DNS IP:

DHCP Mode :  NONE  DHCP Server  DHCP Relay

DHCP Start IP Address:

DHCP End IP Address:

Netmask:

DHCP Lease Time:  seconds

DHCP Server Relay IP:

DHCP Gateway Relay IP:

Enable DNS Proxy:

## Network Mode: Bridging and Routing

### Network Mode:

Select between Bridge (default) and Router mode.

## LAN Setup

### LAN Mode:

**Static:** (default) lets you enter a specific IP address for the device.

Default IP address is 192.168.168.1

**DHCP Client:** when set let device learn the IP address automatically from the network.

### Netmask:

Let you set the class for the IP address set.

Default class C and value is 255.255.255.0

**Gateway:** (optional)

Enter the gateway IP address of the network the device is connected.

**Primary DNS IP:** (optional)

Enter the primary DNS IP address nearest to the gateway router.

**Secondary DNS IP:** (optional)

Enter the secondary DNS IP address nearest to the gateway router.

**DHCP Mode:**

**None:** function disabled

**DHCP Server:** Check to enable. Device act IP address distribution server automatically issue IP address and other network information to the DHCP Client request them.

**DHCP Relay:** check to enable. Enter the IP address of the remote DHCP server where the DHCP Client request will be relayed to.

**DHCP Start IP Address:**

Enter the starting IP address to be issue.

**DHCP End IP Address:**

Enter the last IP address the server will issue.

**Netmask:**

Let you set the IP class for the IP address range set for the start and end address.

\* **Note:-** if device is also the router then IP class must be same as device IP class.

**DHCP Lease Time:** (default is **3600** seconds or 1hour)

Enter the new lease time in seconds.

**DHCP Server Relay IP:**

Enter the IP address of the remote DHCP server where the DHCP Client request will be relay to get the IP address.

**DHCP Gateway Relay IP:**

Enter the IP address of the remote gateway where the DHCP Client request will be relay to get the gateway IP address.

**Enable DNS Proxy:**

Check to enable function. Device router operation will act as proxy to resolve all DNS requests.

## DHCP Reservations

### DHCP SERVER RESERVATIONS

IP Address	Hardware MAC		IP Address	Hardware MAC
192.168.168.100	00:11:22:33:44:55	<a href="#">Remove</a>		
<input type="text"/>	<input type="text"/>	<input type="button" value="Add"/>		

Click **Add** to enter for each device the IP address and MAC address.

All DHCP active lease devices are displayed in the **Status** tab page from the **More Status** selection.

## Domain Name Server Entry

### DOMAIN NAME SERVER ADDRESSES

Obtain DNS server address automatically  
 Use the following DNS server addresses:

Primary DNS IP:   
Secondary DNS IP:

The Primary and Secondary DNS IP addresses entry is for device operation to resolve domain name to reach certain servers like internet time server and other services that use domain name.

\* Note:- Ensure device gateway IP is also set that to allow device to access to internet.

### Primary DNS IP: (optional)

Enter the primary DNS IP address nearest to the gateway router.

### Secondary DNS IP: (optional)

Enter the secondary DNS IP address nearest to the gateway router.

## Bandwidth Control between Ethernet and Wireless

### BANDWIDTH CONTROL SETUP

Ethernet to Wireless Traffic Limit (kbit)-Upload:	<input type="text" value="0"/>
Wireless to Ethernet Traffic Limit (kbit)-Download:	<input type="text" value="0"/>

An entry of value “0” means no bandwidth flow limit between the 2 interfaces.

An entry of “2000” means 2000Kbit or 2Mbit limit traffic flow between the 2 interfaces.

Default is “0”

# Basic Wireless Tab

Under the tab, there is the selection of 4 radios.

Fig 2.1 Basic Wireless Tab

Currently device support only one 802..11n radio card. Select **RADIO 1** to configure.

Basic Wireless Tab contains all the wireless setup, which is necessary for the operator to setup the wireless part of the link.

## Enable the radio

Fig 2.2 Enable Radio Checkbox

Tick/Untick the checkbox to enable/disable the radio.

## Basic Wireless Settings

All the basic wireless settings can be configured in this page. Operators can change the ESSID, regulatory country code, wireless profile, channel spectrum width, frequency of interest, data rates, transmit power and rate aggressiveness.

## Wireless Mode

There are **5 modes** available.

### BASIC WIRELESS SETTINGS

Wireless Mode:	<input type="text" value="Access Point"/>

Rate Aggressiveness:	<input type="text" value="0"/>	

### Access Point

This mode can be connected to **Station** mode, and then forwards all the traffic to the network devices connected to the Ethernet devices of the Station.

### Station:

This is a client mode that can be connected to the Access Point mode. It is used to bridge the wireless connection to an Access Point. It forwards all the traffic to/from the network devices to the Ethernet interface. This mode translates all the packets that pass through device to its own MAC address, thus resulting in a lack of transparency.

## Access Point Parameters Settings

### BASIC WIRELESS SETTINGS

Wireless Mode:	Access Point
Local AP-ESSID:	test <input type="checkbox"/> Hide SSID
Country Code:	United States of America <input checked="" type="checkbox"/> No Country Set
Wireless Profile:	NA
Channel Spectrum Width:	20/40M
Guard Interval:	Short
Channel-Frequency:	5200M <input checked="" type="checkbox"/> Auto <input type="button" value="Select"/>
	<input type="button" value="Interference Analyzer"/>
Data Rate (Mbps):	MCS 15 (300 Mbps) <input checked="" type="checkbox"/> Auto
Transmit Power:	17 dBm Chainmask: 2x2 Dual - Aggregate Dual Chain Power <input checked="" type="checkbox"/> Maximum <input type="checkbox"/> Obey Regulatory Power
Rate Aggressiveness:	0

Fig 2.3 Basic Wireless Settings (Access Point/ Access Point WDS)

### Local AP-ESSID

This is the Service Set Identifier used to identify the operator's wireless LAN. It should be specified while operating in Access Point or Access Point WDS mode.

All the client devices within its range will receive broadcast messages from the access point advertising this SSID.

### Hide SSID:

Once checked, this will disable advertising the SSID of the access point in broadcast messages to wireless stations. This option is only available in Access Point, Access Point WDS and Repeater WDS mode only.

### Country Code

Different countries have different power levels and also frequency selections. To ensure device operation follows regulatory compliance rules, the operator should make sure that correct country code where device will be used, is selected. The channel list, output power limits, IEEE 802.11 and Channel Spectrum Width modes will be tuned according to the regulations of the selected country. **Station setting must match AP country code setting.**

### No Country Set:

Option when checked, only the frequency range are available.

11n 2.4GHz is 2412-2462MHz, 11n 5GHz is 5180-5240MHz and 5745-5825MHz.

### Wireless Profile:

NA is 11n 5GHz band and represents a mixed of 802.11n and 802.11a mode.

NG is 11n 2.4GHz band and represents a mixed of 802.11n, 802.11g and 802.11b mode.

### Channel Spectrum Width

20M represents the data transmitted at a bandwidth of 20MHz. 20/40MHz represents the data transmitted at either 20MHz or 40MHz. In very noisy environment it automatically falls back to 20MHz to be more resilient to the interference. In situation when auto fall back did not happened, manually changing channel spectrum width to 20MHz will to help reduce interference on the link and improve performance.

**\* Note: 40MHz bandwidth is non-standard for 802.11n/g mode operation. If you experience unstable performance change Channel Spectrum Width to 20M.**

## **Channel – Frequency**

This is frequency selection you can set for device to operate on. The frequency range available including 2412-2462MHz, 5180-5240MHz and 5745-5825MHz. Selecting one of these frequencies for operation may affect and delay of 2 minutes or more (possibly up to 10 minutes in some situations) for device to attempt to establish a connection.

**Auto:** When checked, during startup, device automatically select the least interfering channels (or frequency) for the operation.

## **Data Rate**

Data Rates consist of both the legacy rates and the MCS (Modulation Coding Scheme – Only for 802.11n) rates.

6 – 54Mbps are Legacy Rates

MCS0 to MCS7 are 802.11n rates, which uses only 1 stream.

MCS8 to MCS15 are 802.11n rates, which uses 2 streams.

**Auto:** The data rate selected will follow an advanced rate algorithm that takes into condition the amount of errors at the data rate and fine tune to the best data rate it can use.

## **Transmit Power**

The maximum transmit power displayed is determined by the country code and the maximum transmit power of the miniPCI that is being used.

**\*Note on changing channels:**

*When the operator changes the channels and if this new frequency have higher power output permitted by regulation, the power previously selected low power level will remains unchanged. You need to readjust the power level to in order to take advantage higher output power available for the channel*

## **Rate Aggressiveness**

Allows user to reduce or increase transmit rate while still remain in Fully Auto Algorithm.

There are 2 scenarios that Rate Aggressiveness is useful. Environment might be noisy at times. Lower the throughput will ensure better stability. Rate Aggressiveness allows device to reduce the transmit rate, so range or power can be higher.

Choose a range of value from -3, -2, -1

Environment might be free of interference. But the fully auto algorithm might give low throughput. Increase Rate Aggressiveness will increase transmit rate in this case to get higher throughput. Choose a range of value from +3, +2, +1.

## Station Parameters Settings

### BASIC WIRELESS SETTINGS

Wireless Mode:	<input type="text" value="Station"/>	
Remote AP-ESSID:	<input type="text" value="test"/>	<input type="button" value="Site Survey"/>
Remote AP-Lock to MAC:	<input type="checkbox"/> Enabled	<input type="text"/>
Remote AP-Preferred MAC:	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>
Country Code:	<input type="text" value="United States of America"/>	<input checked="" type="checkbox"/> No Country Set
Wireless Profile:	<input type="text" value="NA"/>	
Channel Spectrum Width:	<input type="text" value="20/40M"/>	
Guard Interval:	<input type="text" value="Short"/>	
Data Rate (Mbps):	<input type="text" value="MCS 15 (300 Mbps)"/>	<input checked="" type="checkbox"/> Auto
Transmit Power:	<input type="text" value="17"/> dBm	Chainmask: 2x2 Dual - Aggregate Dual Chain Power
	<input checked="" type="checkbox"/> Maximum	
	<input type="checkbox"/> Obey Regulatory Power	
Rate Aggressiveness:	<input type="text" value="0"/>	
Channel Scan List:	<input type="checkbox"/> Enabled	<input type="button" value="Select"/>

Fig 2.4 Basic Wireless Settings (Station/Station WDS)

This options below are only available in **Station, Station WDS** and **Repeater WDS** modes unless otherwise stated.

**Wireless Mode:** Station

#### Remote AP-ESSID

This is the Service Set Identifier used by station to seek and connect to the access point of same the SSID identifier.

#### Site Survey

Site Survey will search for the available wireless networks in range on all the supported channels and will allow you to select one for association. In case the selected network uses encryption, you'll need to set security parameters in wireless security section. Click Scan to re-scan the Access Points in range. Select the Access Point from the list and click Close this window. Site Survey channel scan list can be modified using the Channel Scan List control.

#### Remote AP – Lock to MAC

Enter the MAC address of the remote access point the device is connected to. This option will make device only connect to this access point. This is important when connection is Point-to-Point operation.

#### Remote AP - Preferred MAC

Enter the preferred MAC address of the access point you want device to connect when it first startup. Up to max of 4 MAC addresses can be entered. Priority is from top to bottom. In the event all preferred MAC addresses are not available, device will then pick the matching SSID access point with the strongest signal.

## Country Code

Different countries have different power levels and also frequency selections. To ensure device operation follows regulatory compliance rules, the operator should make sure that correct country code where device will be used, is selected. The channel list, output power limits, IEEE 802.11 and Channel Spectrum Width modes will be tuned according to the regulations of the selected country. **Station setting must match AP country code setting.**

### No Country Set:

Option when checked, only the frequency range are available.

11n 2.4GHz is 2412-2462MHz, 11n 5GHz is 5180-5240MHz and 5745-5825MHz.

### Wireless Profile:

**NA** is 11n 5GHz band and represents a mixed of 802.11n and 802.11a mode.

**NG** is 11n 2.4GHz band and represents a mixed of 802.11n, 802.11g and 802.11b mode.

**\*\* Station setting must match AP Wireless Profile setting.**

### Channel Spectrum Width

20M represents the data transmitted at a bandwidth of 20MHz. 20/40MHz represents the data transmitted at either 20MHz or 40MHz. In very noisy environment it automatically fall back to 20MHz to be more resilient to the interference. In situation when auto fall back did not happened, manually changing channel spectrum width to 20MHz will to help reduce interference on the link and improve performance.

**\* Note: 40MHz bandwidth is non-standard for 802.11n/g mode operation. If you experience unstable performance change Channel Spectrum Width to 20M.**

**\*\* Station setting must match AP Channel Spectrum Width setting.**

**Maximum :** checking this box will result in maximum Tx output power overriding regulation.

**Obey Regulatory Power :** checking this box will obey Tx output regulatory power by country.

### Channel Scan List

Not Channel scan set

## Wireless Security

All the wireless security settings are set under this section.

The operation of the Keys is the same for ALL the Wireless modes.

### WPA or WPA2 Authentication

#### LOCAL AP - WIRELESS SECURITY:

The screenshot displays the 'LOCAL AP - WIRELESS SECURITY' configuration window. It features several input fields and dropdown menus. The 'Security' dropdown is set to 'WPA', and 'WPA Authentication' is set to 'PSK'. The 'WPA Preshared Key' field contains '11111111'. The 'Cipher Type' dropdown is set to 'AES'. Other fields include 'Pri. Radius Server IP' (0.0.0.0), 'Sec. Radius Server IP' (0.0.0.0), 'Authentication Port' (1812), 'Accounting Port' (1813), and 'Radius Secret Key' (private). There is a checkbox for 'MAC ACL' which is currently unchecked. A 'Policy' dropdown is set to 'Allow'. On the right side, there are 'Add' and 'Remove' buttons next to empty input fields.

Fig 2.7 WPA (Access Point/Access Point WDS/Repeater WDS)

### WPA PSK

**PSK (Default)** – WPA or WPA2 with Pre-shared Key method.

#### Cipher Type

**TKIP** - Temporal Key Integrity Protocol which uses RC4 encryption algorithm.

**AES** - Advanced Encryption Standard (AES) algorithm.

**AUTO (Default)** – Automatically select between both algorithms.

#### Preshared Key

This option is available when **WPA** or **WPA2**, with **PSK** selected.

The pre-shared key is an alpha-numeric password between 8 and 63 characters long.

#### \*\*\* Important:

**802.11n network using WPA authentication should use AES cipher type for connection. Only AES allows highest transmission speed and throughput operation.**

**Using TKIP cipher type device will limit maximum transmission speed of up to 54Mbps only.**

## WPA + EAP

**LOCAL AP - WIRELESS SECURITY:**

Security:	<input type="text" value="WPA"/>		
WPA Authentication:	<input type="text" value="EAP"/>	Cipher Type:	<input type="text" value="AES"/>
WPA Preshared Key:	<input type="text" value="*****"/>		
Pri. Radius Server IP:	<input type="text" value="0.0.0.0"/>		
Sec. Radius Server IP:	<input type="text" value="0.0.0.0"/>		
Authentication Port:	<input type="text" value="1812"/>		
Accounting Port:	<input type="text" value="1813"/>		
Radius Secret Key:	<input type="text" value="private"/>		
MAC ACL:	<input type="checkbox"/> Enabled	<input type="text"/>	<input type="button" value="Add"/>
Policy:	<input type="text" value="Allow"/>	<input type="text"/>	<input type="button" value="Remove"/>

Fig 2.8 WPA + EAP

**EAP** – WPA or WPA2 with EAP (Extensible Authentication Protocol)

Firmware supported options for clients are: EAP-TTLS and EAP-PEAP

### Cipher Type

**TKIP** - Temporal Key Integrity Protocol which uses RC4 encryption algorithm.

**AES** - Advanced Encryption Standard (AES) algorithm.

**AUTO (Default)** – Automatically select between both algorithms.

### Primary Radius Server IP

Enter the Primary Radius Server IP address.

### Secondary Radius Server IP

Enter the Secondary Radius Server IP address.

### Authentication Port

Enter the Authentication Port number of the Radius Server. Default is 1812.

### Accounting Port

Enter the Accounting Port number of the Radius Server. Default is 1813.

### Radius Secret Key

Enter the Secret Key of the Radius Server. The device use this to authenticate itself with Radius Server.

## WPA EAP-TTLS and WPA EAP-PEAP

### REMOTE AP - WIRELESS SECURITY:

Security:	<input type="text" value="WPA"/>		
WPA Authentication:	<input type="text" value="EAP"/>	<input type="text" value="EAP_TTLS"/>	Cipher Type: <input type="text" value="AES"/>
Preshared Key:	<input type="text" value="11111111"/>		
Identity:	<input type="text" value="anonymous"/>		
User Name:	<input type="text" value="user@example.com"/>		
User Password:	<input type="text" value="password"/>		

Fig 2.8 WPA (Station /Station WDS/Repeater WDS)

This apply to the following modes only, when **WPA** or **WPA2**, with **EAP** is selected.  
**Station, Station WDS, Repeater WDS** mode.

### Identity

Identification credential used by the wpa-suppllicant for EAP authentication.

### User Name:

Identification credential used by the wpa-suppllicant for EAP tunneled authentication in unencrypted form.

### User Password:

Password credential used by the wpa-suppllicant for EAP authentication

## IEEE802.1x Settings

The operation of the Keys is the same for ALL the modes.

**\*\* Note: Operating with IEEE802.1x security will limit AP to maximum wireless link speed of 54Mbps only.**

### LOCAL AP - WIRELESS SECURITY:

Security:	<input type="text" value="IEEE802.1X"/>
Pri. Radius Server IP:	<input type="text" value="0.0.0.0"/>
Sec. Radius Server IP:	<input type="text" value="0.0.0.0"/>
Authentication Port:	<input type="text" value="1812"/>
Accounting Port:	<input type="text" value="1813"/>
Radius Secret Key:	<input type="text" value="private"/>
IEEE802.1X Key Rotation:	<input type="text" value="600"/>
IEEE802.1X Key Length:	<input type="text" value="64 bit"/>
MAC ACL:	<input type="checkbox"/> Enabled
Policy:	<input type="text" value="Allow"/>

Fig. 2.8 IEEE802.1X (Access Point/Access Point WDS/ Repeater WDS)

This option apply to the following modes only, when WPA EAP or IEEE802.1x .  
**Access Point, Access Point WDS, Repeater WDS** modes.

### Primary Radius Server IP

Enter the Primary Radius Server IP that Access Point will use to query server.

### Secondary Radius Server IP

Enter the Secondary Radius Server IP that Access Point will use to query the server.

### Authentication Port

Enter the Radius Server Authentication Port number to use. Default is 1812.

### Accounting Port

Enter Radius server Accounting Port to use. Default is 1813.

### Radius Secret Key

Enter Radius server Secret Key that Access Point to use to authenticate itself with radius server.

### IEEE802.1x Key Rotation

Enter time in seconds. Time before activate key rotation in authentication process for higher security.

### IEEE802.1x Key Length

This is the key length of the initial seed key. Select 64 or 128bit.

# WEP

**LOCAL AP - WIRELESS SECURITY:**

Security:	<input type="text" value="WEP"/>		
Authentication Type:	<input checked="" type="radio"/> Open <input type="radio"/> Shared Key		
Key Type:	<input type="text" value="ASCII"/>	Current Key:	<input type="text" value="KEY 1"/>
WEP Key 1:	<input type="text"/>	WEP Key 1 Length:	<input type="text" value="64 bit"/>
WEP Key 2:	<input type="text"/>	WEP Key 2 Length:	<input type="text" value="64 bit"/>
WEP Key 3:	<input type="text"/>	WEP Key 3 Length:	<input type="text" value="64 bit"/>
WEP Key 4:	<input type="text"/>	WEP key 4 Length:	<input type="text" value="64 bit"/>
MAC ACL:	<input type="checkbox"/> Enabled	<input type="text"/>	<input type="button" value="Add"/>
Policy:	<input type="text" value="Allow"/>	<input type="text"/>	<input type="button" value="Remove"/>

Fig 2.6 WEP

The operation of the Keys is the same for ALL the modes.

**\*\* Note: Operating with WEP security will limit AP to maximum wireless link speed of 54Mbps only.**

## Authentication Type:

**Open Authentication** – (Default) No authentication. Recommend to use this standard option over shared authentication.

**Shared Authentication** – May not be compatible with all Access Point. Not recommended.

## Key Type:

**HEX** or **ASCII** option specifies the character format for the WEP key if WEP security method is used.

## Current Key:

Specify the Index of the WEP Key used. 4 different WEP keys can be configured at the same time, but only one is used.

## WEP Key:

WEP encryption key for the wireless traffic encryption and decryption should be specified if WEP security method is used.

## WEP Key Length:

64-bit (selected by default) or 128-bit WEP Key length should be selected if WEP security method is used. The 128-bit option will provide higher level of security.

For **64-bit** – specify WEP key as 5 HEX (0-9, A-F or a-f) pairs (e.g. 00112233AA) or 5 ASCII characters.

For **128-bit** – specify WEP key as 13 HEX (0-9, A-F or a-f) pairs (e.g. 00112233445566778899AABBCC) or 13 ASCII characters.

## Virtual Access Point (VAP)

Virtual AP (VAP) implements mSSID (Multi-SSID) whereby a single wireless card can be setup with up to 3 virtual SSID of BSSID connections. Each VAP can be set with different security authentication mode.

### BASIC WIRELESS SETTINGS

VAP-ESSID:	Mimo-Series-VAP-0	<input type="checkbox"/> Hide SSID
------------	-------------------	------------------------------------

### WIRELESS SECURITY:

Security:	none
-----------	------

Apply Settings

Fig 2.11 Virtual AP (Only Available in Access Point/ Access Point WDS Mode)

All VAPs are created from the same radio they all share the same wireless channel, country code, channel spectrum width and transmit power.

**\* Note: Security options like IEEE802.1x and WPA-EAP uses radius server for authentication and accounting. You may not use different secret key for each VAP. Or you should configure only for one SSID with radius authentication.**

# Advance Wireless Tab

Not Advance Wireless Setup

# Advanced Network Tab

Click **Advanced Network** tab from menu to open the page below.

**\*Note:** This tab will not open when in device is in Bridge mode.

To open page, first enabled Router mode in Basic Network

STATUS	BASIC WIRELESS	BASIC NETWORK	ADVANCED WIRELESS	<b>ADVANCED NETWORK</b>	SERVICES	SYSTEM

UPnP:	<input checked="" type="checkbox"/> Enabled
-------	---

## Spanning Tree Setup

#### SPANNING TREE PROTOCOL (STP) SETUP

Spanning Tree Protocol:	<input type="checkbox"/> Enabled	
Root Priority:	<input type="text" value="32768"/>	(Range : 0 to 65536)
Root Hello Time:	<input type="text" value="2"/>	(Range : 1 to 10)
Root Forward Delay:	<input type="text" value="15"/>	(Range : 4 to 30)
Root Maximum Age:	<input type="text" value="20"/>	(Range : 6 to 40)

**Spanning Tree Protocol:** Default is **disabled**. Check on box to enable.

**Root Priority:** Default value is 32768. Smaller value has higher priority.

**Root Hello Time:** Default time is 2 seconds.

**Root Forward Delay:** Default is 15 seconds

**Root Maximum Age:** Default is 20 seconds

Changing to lower time can caused high overheads to the network.

## NAT Setup

### NAT SETUP

NAT:	<input type="checkbox"/> Enabled	
DMZ:	<input type="checkbox"/> Enabled	
DMZ Private IP:	<input type="text" value="0.0.0.0"/>	
Port Forwarding:	<input type="checkbox"/> Enabled	<input type="button" value="Configure"/>
IP Forwarding:	<input type="checkbox"/> Enabled	<input type="button" value="Configure"/>

**NAT:** Enabled when in Router mode. Disabled when in Bridge mode.

**DMZ:** Default is disabled. Check on box to enable.

**DMZ IP Address:** Input IP address of the local PC to receive the DMZ packets.

Port Forwarding: Default is disabled. Check on box to enable.

For configuration refer to Appendix section.

### Known Server

Server Type	Private IP Address	Public IP	From	To
HTTP	192.168.168.10	All	80	

### Adding an entry from Known Server

Add entry from this box and select an application the list.

**Server Type:** click to select the application you want to add.

**Private IP Address:** Enter the local IP of the PC running the application

**Public IP Address:** If the application to for any people on the internet to access then select the default, **All**.

If only specific IP, select **Single** and enter the IP address.

If only specific range of IP, select **Range** and enter IP address range.

### Custom Server

Server Type	Protocol	Public Port	From	To
web server	TCP	Single	80	
Private IP Address	Private Port From	Public IP	From	To
192.168.168.10	81	All		

### Adding an entry from Custom Server

Entry from Custom Server box lets you enter the other port number service for an application and new applications.

Custom Server also lets you enter a different public and private port service

**Server Type:** Enter a brief name for the application. This info helps you track the application for that port number you set.

**Protocol:** Select TCP or UDP the application use.

**Public Port:** select Single or Range of ports application use.

**From:** if single port, enter this box only. If port range, enter starting port number here.

**To:** if single port, leave blank. if port range enter, enter last port number here.

**Private IP Address:** Enter the local IP of the PC running the application

**Private Port From:** If single port, enter same public port number or new port number.

If port range, enter only the starting port number.

**Public IP Address:** If the application is to access by any people on the internet, then select the default, **All**.

If only specific IP, select **Single** and enter the IP address.

If only specific range of IP, select **Range** and enter IP address range.

#### IP FORWARD ENTRIES

Private IP	Public IP	
<input type="text" value="192.168.168.200"/>	<input type="text" value="206.12.100.50"/>	<input type="button" value="Add"/>

Private IP	Public IP	
		<input type="button" value="Apply Setting"/>

**IP Forwarding:** Default is disabled. Check on box to enable.

For configuration refer to Appendix section.

Private IP: enter the local IP address to receive forward packet by the public IP

Public IP: enter the public IP address when access will forward all packet to the local IP

Click Add to add to list.

#### ROUTING INFORMATION PROTOCOL (RIP) SETUP:

Routing Info.Protocol:	<input type="checkbox"/> Enabled
Routing Info.Protocol Version:	<input type="text" value="RIPv1"/>

**Routing Information Protocol:** Default is disabled. Check on box to enable.

For configuration refer to Appendix section.

**Router Info Protocol version:** select RIPv1 or RIPv2

## Firewall Setup

Firewall

<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				
<input type="checkbox"/>		ACCEPT	TCP				

**Firewall Setup:** Default is disabled. Check on box to enable.

For configuration refer to Appendix section.

**Comment:** enter a brief name for the service.

**Policy:** select Accept or Deny for the apply rule

**IP Type:** select ICMP, TCP, and UDP packet type to check

**Source IP/Mask:** enter the source IP address and Netmask

Is the source IP of the packet (specified within the packet header), usually it is the IP of the host system which sends the packets;

**Src Port:** enter the source port number in rule check

Is the source port of the TCP/UDP packet (specified within the packet header), usually it is the port of the host system application which sends the packets.

**Destination IP/Mask:** enter the destination IP and Netmask

Is the Destination IP of the packet (specified within the packet header), usually it is the IP of the system which the packet is addressed to;

**Des Port:** enter the destination port in rule check

Is the destination port of the TCP/UDP packet (specified within the packet header), usually it is the port of the host system application which the packet is addressed to

Click **Apply** to the rule or **Cancel** to clear the rule set.

## Outbound Filtering Setup

### FILTERING SETUP:

Packet Filtering:	<input type="checkbox"/> Enabled	<input type="button" value="Configure"/>
URL Filtering:	<input type="checkbox"/> Enabled	<input type="button" value="Configure"/>
Multicasting Filtering:	<input type="checkbox"/> Enabled	<input type="button" value="Configure"/>

**Filtering Setup:** Default is disabled. Check on box to enable.

For configuration refer to Appendix section.

### DNS REDIRECTION SETUP:

DNS Redirection:	<input checked="" type="checkbox"/> Enabled
------------------	---

**DNS Redirection:** Default is enabled. Check on box to disable. When enabled, router device will act as DNS proxy. PC connected to this router device to set their TCPIP DNS IP to router's IP address. PC can still setup a valid DNS IP to skip the DNS proxy handling.

### DYNAMIC DNS SETUP:

Dynamic DNS:	<input type="checkbox"/> Enabled	Domain Name:	<input type="text"/>	<input type="button" value="Add"/>
				<input type="button" value="Remove"/>

**Dynamic DNS Setup:** Default is disabled. Check on box to enable.

Dynamic DNS let router's WAN dynamic IP address linked and automatically updated to domain server hosting the service each time the IP address is changed. These ensured users on the internet can always get access to the hosting service behind the router.

For configuration refer to Appendix section.

### DNS RELAY SETUP:

DNS Relay:	<input checked="" type="checkbox"/> Enabled
Primary DNS IP Address:	<input type="text" value="203.120.90.60"/>
Secondary DNS IP Address:	<input type="text" value="203.120.90.40"/>

**DNS Relay Setup:** Default is disabled. Check on box to enable.

These are the primary and secondary DNS IPs device proxy service use to resolve the domain name on behalf of the client PCs.

**Primary DNS IP Address:** Enter the primary DNS IP address

**Secondary DNS IP Address:** Enter the secondary DNS IP address

### UPNP SETUP:

UPnP:	<input checked="" type="checkbox"/> Enabled
-------	---

**UPNP:** Default is disabled. Check on box to enabled.

When enabled, client PC running Microsoft UPnP services can automatically open certain specific port required by the PC application in the router.

For security reason this service should not be open.

Recommend to setup manually open all port service through **Port Forwarding** service.

# Services Tab

Click **Services** tab from menu to open the page below.

Services section provides varieties of useful and enhanced functions to help assist device operations.

<b>STATUS</b>	<b>BASIC WIRELESS</b>	<b>BASIC NETWORK</b>	<b>ADVANCED WIRELESS</b>	<b>ADVANCED NETWORK</b>	<b>SERVICES</b>	<b>SYSTEM</b>
---------------	-----------------------	----------------------	--------------------------	-------------------------	-----------------	---------------

### PING WATCHDOG

Enable Ping Watchdog:	<input type="checkbox"/>
IP Address To Ping:	<input type="text" value="192.168.168.1"/>
Ping Interval:	<input type="text" value="5"/> seconds
Startup Delay:	<input type="text" value="60"/> seconds
Failure Count To Reboot:	<input type="text" value="5"/>
<input type="button" value="Apply"/>	

### AUTO-REBOOT

Auto Reboot Mode:	<input type="text" value="Disabled"/>
<input type="button" value="Apply"/>	

### SNMP SETUP

Enable SNMP:	<input type="checkbox"/>
Read Password:	<input type="text" value="public"/>
Engine ID:	<input type="text" value="800007e5BD00002704I"/>
Enable SNMP Trap:	<input type="checkbox"/>
Trap Destination IP:	<input type="text" value="192.168.168.1"/>
Community:	<input type="text" value="public"/>
<input type="button" value="Apply"/>	

### NTP SETUP

Select Your Time Zone:	<input type="text" value="GMT-07:00 (Mountain Time (US &amp; Canada), ...)"/>
Enable NTP Client:	<input checked="" type="checkbox"/>
Custom Time Server:	<input type="text" value="time.nist.gov"/>
Known Time Server:	<input type="text" value="bonehed.lcs.mit.edu"/>
<input type="button" value="Apply"/>	

### WEB SERVER

Web server mode:	<input type="text" value="HTTP"/>
HTTPS Port:	<input type="text" value="80"/>
<input type="button" value="Apply"/>	

### TELNET SERVER

Enable Telnet Server:	<input checked="" type="checkbox"/>
Server Port:	<input type="text" value="23"/>
<input type="button" value="Apply"/>	

### SSH SERVER

Enable SSH Server:	<input type="checkbox"/>
Server Port:	<input type="text" value="22"/>
<input type="button" value="Apply"/>	

### SYSTEM LOG

Enable System Log:	<input type="checkbox"/>
Logging IP/Domain Name:	<input type="text" value="192.168.168.1"/>
Logging Port:	<input type="text" value="514"/>
<input type="button" value="Apply"/>	

## Ping Watchdog

### PING WATCHDOG

Enable Ping Watchdog:	<input type="checkbox"/>
IP Address To Ping:	<input type="text" value="192.168.168.1"/>
Ping Interval:	<input type="text" value="5"/> seconds
Startup Delay:	<input type="text" value="60"/> seconds
Failure Count To Reboot:	<input type="text" value="5"/>
	<input type="button" value="Apply"/>

**Enable Ping Watchdog:** Default is disabled. Check on box to enable.

**IP Address To Ping:** Target IP address do ping test monitor.

**Ping Interval:** Default is 5 seconds (minimum). This is Ping test duration.

**Startup Delay:** Default is 60 seconds(minimum).

One time delay after device startup.

**Failed Count To Reboot:** Default is 5. This is the number of ping failure count before device kick in the reboot process.

## Auto-Reboot

### AUTO-REBOOT

Auto Reboot Mode:	<input type="text" value="Disabled"/>
-------------------	---------------------------------------

**Auto-Reboot Mode:** Default is disabled. Select By Hour or By Time check.

This mode lets you preset a timer to automatically force a reboot.

Timer can in fixed number of hours or at a specified time of day.

**By Hour:** Enter the number of hours device need to run before kick start reboot process.

**By Time:** Enter the specific time of day in hh:mm (24-hour format) to kick start reboots process.

## SNMP Setup

### SNMP SETUP

Enable SNMP:	<input checked="" type="checkbox"/>
Read Password:	<input type="text" value="public"/>
Engine ID:	<input type="text" value="800007e5BD000027041"/>
Enable SNMP Trap:	<input type="checkbox"/>
Trap Destination IP:	<input type="text" value="192.168.168.1"/>
Community:	<input type="text" value="public"/>
<input type="button" value="Apply"/>	

**Enable SNMP:** Default is disabled. Check on box to enable.

**Read Only Password:** Password to query device.

**Engine ID:** Default is 800007e5BD00002704D000007c

**Enable SNMP Trap:** Default is disabled. Check on box to enable.

**Trap Destination IP:** Enter the IP to send the info when trap is triggered.

**Community:** Enter the SNMP community string.

## NTP Setup

### NTP SETUP

Select Your Time Zone:	<input type="text" value="GMT-07:00 (Mountain Time (US &amp; Canada), ...)"/>
Enable NTP Client:	<input checked="" type="checkbox"/>
Custom Time Server:	<input type="text" value="time.nist.gov"/>
Known Time Server:	<input type="text" value="bonehed.lcs.mit.edu"/>
<input type="button" value="Apply"/>	

**Enable NTP Client:** Default is disabled. Check on box to enable.

**Select Your Time Zone:** Select from list the country you reside.

**Custom Time Server:** Default is "time.nist.gov" Enter preferred time server domain or IP

**Known Time Server:** You can also select one from this list as your new time server.

## Web HTTP Security

### WEB SERVER

Web server mode:	<input type="text" value="HTTP"/>
HTTPS Port:	<input type="text" value="80"/>
<input type="button" value="Apply"/>	

**Web Server Mode:** Default is HTTP. Option is HTTP and HTTPS

**HTTP(s) Port:** Default is 80 for HTTP and 413 for HTTPS.

Enter a new preferred port number.

## Telnet Access Setup

### TELNET SERVER

Enable Telnet Server:	<input checked="" type="checkbox"/>
Server Port:	<input type="text" value="23"/>
	<input type="button" value="Apply"/>

**Enable Telnet Server:** Default is enabled. Remove check on box to disable.

**Server Port:** Default is 23. Enter new preferred port number.

## SSH Access Setup

### SSH SERVER

Enable SSH Server:	<input type="checkbox"/>
Server Port:	<input type="text" value="22"/>
	<input type="button" value="Apply"/>

**Enable SSH Server:** Default is disabled. Check on box to enable.

**Server Port:** Default is 22. Enter new preferred port number.

## System Log Setup

### SYSTEM LOG

Enable System Log:	<input type="checkbox"/>
Logging IP/Domain Name:	<input type="text" value="192.168.168.1"/>
Logging Port:	<input type="text" value="514"/>
	<input type="button" value="Apply"/>

**Enable System Logging:** Default is disabled. Check on box to enable.

**Logging IP /Domain Name:** Enter destination IP address of device to receive log.

**Logging Port:** Default is 514. Enter the new preferred port number.

# System Tab

The System Page contains Administrative options. This page enables administrator to customize, reboot the device, set it to factory defaults, upload a new firmware, backup or update the configuration and configure administrator's credentials.

## Firmware Upgrade

### FIRMWARE UPGRADE

The screenshot shows a web interface for firmware upgrade. It has a title 'FIRMWARE UPGRADE'. Below the title is a form with a label 'Firmware Version:' followed by a text input field containing '2.01 (build 090727)'. To the right of the input field is a 'Browse...' button. Below the input field is an 'Upgrade' button.

Use this section to find out current software version and update the device with the new firmware. The device firmware update is compatible with all configuration settings. System configurations are preserved while the device is updated with a new firmware version.

**Firmware version:** displays the version of the current firmware of the device system.

**Upgrade:** button opens the Firmware Upload window if activated.

**Current Firmware:** displays the version of the device firmware which is currently operating.

**Firmware File:** activate Browse button to navigate to and select the new firmware file. The full path to the new firmware file location can be specified there. New firmware file is transferred to the system after Upload button is activated.

**Close this window** – button cancels the new firmware upload process if activated.

**Upgrade button** should be activated in order to proceed with firmware upgrade routine (new firmware image should be uploaded into the system first). Please be patient, as the firmware upgrade routine can take 3-7 minutes. The based device will be un-accessible until the firmware upgrade routine is completed.

**Do not switch off, do not reboot and do not disconnect the device from the power supply during the firmware upgrade process as these actions will damage the device!**

It is highly recommended to backup the system configuration and the Support Info file before uploading the new configuration.

**Close this window** – button closes the firmware upgrade window if activated.

This action will not cancel the firmware upgrade process.

## Host Name

### HOST NAME

Host Name:	<input type="text" value="AP"/>
	<input type="button" value="Apply"/>

Host Name is the system wide device identifier. It is reported by SNMP Agent to authorized management stations. Host Name will be represented in popular Router Operating Systems registration screens and discovery tools.

**Host Name:** specifies the system identity.

**Change button** saves the Host Name if activated.

## Administrative and Read-only Account

### ADMINISTRATIVE ACCOUNT

Administrator Username:	<input type="text" value="admin"/>
Current Password:	<input type="password"/>
New Password:	<input type="password"/>
Verify New Password:	<input type="password"/>
	<input type="button" value="Apply"/>

In this section you can modify the administrator password to protect your device from unauthorized configuration. The default administrator's password should be changed on the very first system setup:

**Administrator Username:** specifies the name of the system user.

**Current Password:** administrator is required to enter a current password. It is required for Password or Administrator Username change routine.

Default administrator login credentials:

- User Name: **admin**
- Password: **password**

**New Password:** new password used for administrator authentication should be specified.

**Verify Password:** new password should be re-entered to verify its accuracy.

Click **Change button** to save the changes.

## Enable Read-Only Account

### READ-ONLY ACCOUNT

Enable Read-Only Account:	<input checked="" type="checkbox"/>
Read-Only Username:	<input type="text" value="guest"/>
Password:	<input type="password"/>
	<input type="button" value="Apply"/>

**Read-Only Username**

**Password:** new password used for read-only administrator authentication should be specified.

## Configuration Management

### CONFIGURATION MANAGEMENT

Backup Configuration:	<input type="button" value="backup..."/>
Upload Configuration:	<input type="text"/> <input type="button" value="Browse..."/>
	<input type="button" value="Restore"/>

**Backup Configuration:** click Download button to export the current configuration to a file.

**Upload Configuration:** click Browse button to navigate to and select the new configuration file or specify the full path to the configuration file location.

Activating the Upload button will transfer new configuration file to the system.

New configuration will be effective after the Apply button is activated and system reboot cycle is completed. Previous system configuration is deleted after Apply button is activated. It is highly recommended to backup the system configuration before uploading the new configuration.

Use only configuration backups of the same type device - configuration backed up from PowerStation2 suits only PowerStation2, but not LiteStation2 or LiteStation5! Behavior may be unpredictable when mixing configurations from different type devices.

## Device Maintenance

### DEVICE MAINTENANCE

<input type="button" value="Reboot..."/>	<input type="button" value="Reset to defaults..."/>
--	---

The controls in this section are dedicated for the device maintenance routines: rebooting, resetting, generating of the support information report.

**Reboot:** activate Reboot control in order to initiate full reboot cycle of the device. Reboot effect is the same as the hardware reboot which is similar to the power off - power on cycle. The system configuration is not modified after the reboot cycle completes. Any non-applied changes will be lost.

**Reset to Defaults:** activate Reset to Defaults control in order to initiate reset the device to factory defaults routine. Reset routine initiates system Reboot process (similar to the power off - power on cycle). The running system configuration will be deleted and the default system configuration (all the system settings with no exception) will be set.

After the **Reset to Defaults** routine is completed, the device system will return to the default IP configuration (192.168.168.1/255.255.255.0) and will start operating in Station-Bridge mode. It is highly recommended to backup the system configuration before the Reset to Defaults is initiated.

# Status Page

ARP Table	
Bridge Table	
DHCP Active Leases	

The Status Page displays a summary of link status information, current values of basic configuration settings (depending on operating mode), network settings and traffic statistics of all the interfaces.

## Status Reporting

### Main

**Uptime:** displays device up time since boot up. The time is expressed in days, hours, minutes and seconds.

**Host Name:** displays the assigned device host name (ID).

**System Time:** display device current date and time. Accurate system date and time is retrieved from the internet services using NTP (Network Time Protocol) if device is setup and connected to internet. Otherwise, the date and time update from device own inaccurate autonomous clock.

**Version Firmware Version:** displays current firmware version in operation.

**Loader Version:** displays current loader version of the device.

## **LAN Setting**

**LAN MAC:** displays the MAC address of the device LAN (Ethernet) interface.

**LAN Mode:** displays the mode used, either static or DHCP client.

**LAN IP Address:** displays the current IP address of the LAN (Ethernet) interface.

**LAN Gateway IP Address:** displays the IP address of the gateway used in LAN.

**LAN Pri. DNS IP:** displays the Primary DNS IP address of the LAN setting.

**LAN Sec. DNS IP:** displays the Secondary DNS IP address of the LAN setting.

## **WAN Setting**

**WAN MAC:** displays the MAC address of the device WAN interface.

**WAN Mode:** displays the mode used, either DHCP, PPPoE or Static IP.

**WAN IP Address:** displays the current IP address of the WAN interface.

**WAN Gateway IP Address:** displays the IP address of the gateway used in WAN.

**WAN Pri. DNS IP:** displays the Primary DNS IP address of the WAN setting.

**WAN Sec. DNS IP:** displays the Secondary DNS IP address of the WAN setting.

## **Radio**

**Wireless Mode:** displays the current operating mode of the device.

**Local AP SSID:** displays the current SSID (Service Set Identifier) of device when operates in access point mode.

**Frequency:** displays current operating frequency running in device.

**WLAN MAC:** displays the MAC address or BSSID of the current active WLAN card running in device.

**WLAN Local/Remote AP MAC:** displays the MAC address of the WLAN card connected to it.

**WLAN Security:** display the current active security mode.

## Clients Connection Status in AP Status Info

All clients connected to AP can be view from AP Status page.

Below is an example of a client connection status info.

Click  to refresh client connection statistics and status page

**Radio 1**

Wireless Mode: <input type="text" value="Access Point WDS"/>	MAC: <input type="text" value="00-80-48-65-ad-c0"/>
LOCAL AP SSID : <input type="text" value="vlan-test"/>	LOCAL AP MAC: <input type="text" value="00-80-48-65-ad-c0"/>
Frequency: <input type="text" value="5.18 GHz"/>	Security: <input type="text" value="WPA2"/>

### WLAN Connected Status:

**MAC Address:** displays the MAC address of the current active WLAN card.

**Signal Strength:** displays the received wireless signal level of opposite connected device.

**TX Rate and RX Rate:** displays the current 802.11 data transmission (TX) and data reception (RX) rate while operating in Station mode. Typically, the higher the signal, the higher the data rate and consequently the higher the data throughput.

**Channel Width:** **HT20** indicates established connection is 20MHz channel width  
**HT40+** indicates established connection is 40MHz channel width

### WLAN Local AP Statistics:

Bytes transmitted/received value represents the total amount of data (in bytes) transmitted and received during the connection;

**WLAN Local AP Errors:** section displays the counters of 802.11 specific errors which were registered on wireless interface:

**Rx invalid NWID** value represents the number of packets received with a different NWID or ESSID - packets which were destined for another access point. It can help to detect configuration problems or identify the adjacent wireless network existence on the same frequency.

**Rx Invalid Crypt** value represents the number of transmitted and received packets which were encrypted with the wrong encryption key and failed the decryption routines. It can be used to detect invalid wireless security settings and encryption break attempts.

**Rx Invalid Frag** value represents the number of packets missed during transmission and reception. These packets were dropped due to re-assembling failure as some link layer fragments of the packet were lost.

**Tx Excessive Retries** value represents the number of packets which failed to be delivered to the destination. Undelivered packets are retransmitted a number of times before an error occurs.

**Missed beacons** value represents the number of beacons (management packets sent at regular intervals by the Access Point) which were missed by the client. This can indicate that the wireless client is out of range.

**Other errors** value represents the total number of transmitted and received packets that were lost or discarded for other reasons.

## More Status

In More Status option contains some useful tools and additional status pages.

**Ping Utility** – a ping tool to test the connectivity between devices.

**NETWORKING PING**

Destination IP/HOST:  Packet Count:  continuous   
 Packet Size:  bytes

Host	Time	TTL
192.168.2.34	0.611 ms	64
192.168.2.34	0.512 ms	64
192.168.2.34	0.508 ms	64

3 of 3 packets received , 0% loss

Min: 0.508 ms Avg: 0.544 ms Max: 0.611 ms

**ARP Table** display a list of MAC addresses of the connected devices

### ARP TABLE

IP address	HW type	Flags	HW address	Mask	Device
192.168.168.213	0x1	0x2	00:80:48:15:7D:F1	*	br0
192.168.168.204	0x1	0x2	00:30:CE:06:35:10	*	br0

**Bridge Table** display a list the devices connect to the bridge interface

### BRIDGE TABLE

Port No	Mac Address	Is Local	Agein Timer
1	00:30:ce:06:35:10	no	0.19
1	00:30:ce:06:6f:10	no	1.40
2	00:80:48:15:7d:f1	no	0.47
3	00:80:48:65:0b:e7	no	0.61
1	00:80:48:65:ad:bf	yes	0.00
2	00:80:48:65:ad:c0	yes	0.00
2	00:80:48:66:9f:a4	no	0.56
3	06:80:48:65:ad:c0	yes	0.00
3	06:80:48:65:ad:c0	yes	0.00
3	06:80:48:65:ad:c0	yes	0.00

**DHCP Active Lease Table** display a list of IPs addresses leased to all computers.

### DHCP ACTIVE LEASES

HOST NAME	IP ADDRESS	HARDWARE MAC	LEASE EXPIRED TIME
STATION-4	192.168.88.214	00-80-48-15-5D-E1	FRI DEC 31 17:03:32 1999

# VLAN Tab

This setup lets you create virtual local network connection through the device Ethernet only and over wireless connections.

By default **VLAN** mode is disabled and checked on **No Vlan**

## VLAN Switch

To setup VLAN network check on **Vlan Switch**

### VLAN MODES

<input type="radio"/>	No Vlan
<input checked="" type="radio"/>	Vlan Switch
<input type="radio"/>	Vlan Management

### ETHERNET VLAN

Default VLAN ID: 2001			
VLAN ID	Tag	VLAN ID	Tag
2001	Tag		Delete
	Tag		Add

### RADIO 1 VLAN

<b>Main</b>	<b>VAP1</b>	<b>VAP2</b>	<b>VAP3</b>
Default VLAN ID: 2001			
VLAN ID	Tag	VLAN ID	Tag
2001	Tag		Delete
	Tag		Add

To add a Tag VLAN ID for Ethernet port, type in the ID number select **Tag** and click **Add**

To add a Tag VLAN ID for MAIN wireless SSID, type in the ID number select **Tag** and click **Add**

To add a Tag VLAN ID for VAP1 wireless SSID, type in the ID number select **Tag** and click **Add**

To add a Tag VLAN ID for VAP2 wireless SSID, type in the ID number select **Tag** and click **Add**

To add a Tag VLAN ID for VAP3 wireless SSID, type in the ID number select **Tag** and click **Add**

**\*\*\* Warning:** Adding a Tag VLAN ID to device interface port can cause lost of connection to device web manager if the PC ethernet port or wireless connection do not have a Tag VLAN ID or do not have the same Tag VLAN ID setup in device.

If this happened, use the device Reset button to clear the config and reconfigure.

Refer Reset button operations section.

Similarly, to add an untag VLAN ID enter the ID number and select **Untag** and click **Add**

Refer to **Appendix V** for VLAN setup examples.

## VLAN Management

Vlan management lets you control and limit only clients connection of same tag vlan ID group be open AP device web page.

**\* Note:-**

**Vlan Management works only in tag vlan pass-through mode. i.e. Vlan Switch is disabled. When Vlan Switch is enabled or configured, Vlan Management function stops operation.**

### VLAN MODES

<input type="radio"/>	No Vlan
<input type="radio"/>	Vlan Switch
<input checked="" type="radio"/>	Vlan Management

### VLAN MANAGEMENT

VLAN ID	IP ADDRESS	
<input type="text"/>	<input type="text"/>	<input type="button" value="Add"/>
MANAGEMENT IP	VLAN ID	IP ADDRESS
<input type="radio"/>	2002	192.168.168.10
<input checked="" type="radio"/>	2001	192.168.168.20

Example:

Assuming there are 2 VLAN ID groups, 2001 and 2002 setup in AP device.

One entry in Vlan Management has Vlan ID 2001 with masquerade IP address 192.168.168.20

Another entry in Vlan Management has Vlan ID 2002 with masquerade IP address 192.168.168.10

You can only select one of the 2 entries to be the active Vlan ID and IP address.

If Vlan ID 2001 group is selected, then only computers in that Vlan ID group can open the AP device web page using the IP address, <http://192.168.168.20>

To change to other ID group say, Vlan ID 2002, mark the radio button under Management IP, then click Apply and Saved.

If there is no entry in Vlan Management, there is no restriction. All computers can open the AP device web page by the default IP address setup in Basic Network page.

# Appendix I - Network

This section provides more detailed explanation on the network operation modes in general.

The Network Page allows the administrator to setup bridge or routing functionality.

Device can operate in bridge or router mode. The IP configuration as described below is required for device management purposes. IP addresses can either be retrieved from a DHCP server or configured manually. Use the Network menu to configure the IP settings.

## Network Mode Selections

**Network Mode:** Specify the operating network mode for the device.

The mode depends on the network topology requirements:

**Bridge** operating mode is selected by default as it is widely used by the subscriber stations, while connecting to Access Point or using WDS. In this mode the device will act as a transparent bridge and will operate in Layer 2. There will be no network segmentation while broadcast domain will be the same. Bridge mode will not block any broadcast or multicast traffic. Additional Firewall settings can be configured for Layer 2 packet filtering and access control in Bridge mode.

**Router** operating mode can be configured in order to operate in Layer 3 to perform routing and enable network segmentation – wireless clients will be on different IP subnet.

Router mode will block broadcasts while it is not transparent.

Device supports Multicast packet pass-through in Router mode. Router can act as DHCP server and use Network Address Translation (Masquerading) feature which is widely used by the Access Points. NAT will act as the firewall between LAN and WLAN networks. Additional Firewall settings can be configured for Layer 3 packet filtering and access control in Router mode.

## Bridge Mode

### Bridge Mode Network Settings

In bridge mode the device forwards all the network management and data packets from one network interface to the other without any intelligent routing. For simple applications this provides efficient and fully transparent network solution. WLAN (wireless) and LAN (Ethernet) interfaces belong to the same network segment which has the same IP address space. WLAN and LAN interfaces form the virtual bridge interface while acting as the bridge ports. The bridge has assigned IP settings for management purposes:

**Bridge IP Address:**

The device can be set for static IP or can be set to obtain an IP address from the DHCP server it is connected to. One of the IP assignment modes must be selected:

**DHCP :** choose this option to assign the dynamic IP address, Gateway and DNS address by the local DHCP server.

**STATIC :** choose this option to assign the static IP settings for the bridge interface.

IP Address: enter the IP address of the device while Static Bridge IP Address mode is selected. This IP will be used for the device management purposes.

IP Address and Netmask settings should consist with the address space of the network segment where device resides. If the device IP settings and administrator PC (which is connected to the device in wired or wireless way) IP settings will use different address space, the device will become unreachable.

**Netmask:** This is a value which when expanded into binary provides a mapping to define which portions of IP address groups can be classified as host devices and network devices.

Netmask defines the address space of the network segment where device resides. 255.255.255.0 (or /24) Netmask is commonly used among many C Class IP networks.

**Gateway IP:** Typically, this is the IP address of the host router which provides the point of connection to the internet. This can be a DSL modem, Cable modem, or a WISP gateway router. Device will direct the packets of data to the gateway if the destination host is not within the local network. Gateway IP address should be from same address space (on same network segment) as the device.

**Primary/Secondary DNS IP:**

The Domain Name System (DNS) is an internet "phone book" which translates domain names to IP addresses. These fields identify the server IP addresses of where the device looks for the translation source.

Primary DNS server IP address should be specified for the device management purposes.

Secondary DNS server IP address is optional. It is used as the fail-over in case the primary DNS server will become unresponsive.

**Spanning Tree Protocol:**

Multiple interconnected bridges create larger networks using the IEEE 802.1d Spanning Tree Protocol (STP), which is used for finding the shortest path within network and to eliminate loops from the topology.

If the STP is turned on, the Bridge device will communicate with other network devices by sending and receiving Bridge Protocol Data Units (BPDU). STP should be turned off (selected by default) when the device is the only bridge on the LAN or when there are no loops in the topology as there is no sense for the bridge to participate in the Spanning Tree Protocol in this case.

## Bridge mode Firewall Configuration Settings

**Firewall** functionality on bridge interface can be enabled using the "Enable Firewall" option. Bridge Firewall rules can be configured, enabled or disabled while using Firewall configuration window which is opened with the "Configure" button.

Firewall entries can be specified by using the following criteria:

**Interface** the interface (WLAN or LAN) where filtering of the incoming/passing-through packets is processed;

**IP Type** sets which particular L3 protocol type (ICMP, TCP, and UDP) should be filtered;

**Source IP/mask** is the source IP of the packet (specified within the packet header), usually it is the IP of the host system which sends the packets;

**Source Port** is the source port of the TCP/UDP packet (specified within the packet header), usually it is the port of the host system application which sends the packets;

**Destination IP/mask** is the destination IP of the packet (specified within the packet header), usually it is the IP of the system which the packet is addressed to;

**Destination Port** is the destination port of the TCP/UDP packet (specified within the packet header), usually it is the port of the host system application which the packet is addressed to.

**Comments** is the informal field for the comment of the particular firewall entry. Few words about the particular firewall entry purpose are saved there usually.

**On** flag enables or disables the effect of the particular firewall entry. All the added firewall entries are saved in system configuration file, however only the enabled firewall entries will be active during the system operation.

New Firewall entries can be saved by activating Apply button or discarded by activating Cancel button in the Firewall configuration window.

All the active firewall entries are stored in the FIREWALL chain of the ebtables filter table, while the device is operating in Bridge mode.

Click Apply Setting and Save Changes button to save the changes made in the Network page.

# Appendix II – Wireless with Router Mode

This section provides more details on wireless with router function.

The role of the LAN and WLAN interface will change accordingly to the **Wireless Mode** while the device is operating in **Router** mode:

- Wireless interface and all the wireless clients connected are considered as the internal LAN and the Ethernet interface is dedicated for the connection to the external network while the device is operating in AP/AP WDS wireless mode;
- Wireless interface and all the wireless clients connected is considered as the external network and the all the network devices on LAN side as well as the Ethernet interface itself is considered as the internal network while the device is operating in Station/Station WDS mode.

Wireless/wired clients are routed from the internal network to the external one by default. Network Address Translation (NAT) functionality works the same way.

## AP-Router mode Network Settings

**IP Address:** This IP addresses represents the LAN or WLAN interface which is connected to the internal network according to the wireless operation mode described above. IP will be used for routing in internal network (it will be the Gateway IP for all the devices connected on the internal network). IP address also will be used for the management purpose of the device.

**WLAN IP Address:** This IP addresses represents the LAN or WLAN interface which is connected to the external network according to the wireless operation mode described above. This is the IP address can be used for the routing and the device management purposes. The external network interface can be set for static IP or can be set to obtain an IP address from the DHCP server which should reside in the external network. One of the IP assignment modes must be selected for the external network interface:

**DHCP** – choose this option to obtain the IP address, Gateway and DNS address dynamically from the external DHCP server.

**PPPoE** – choose this option to obtain the IP address, Gateway and DNS address dynamically from the external PPPoE server.

**Static** – choose this option to assign the static IP settings for the external interface. IP Address and Netmask settings should consist with the address space of the network segment where the device resides. If the device IP settings and administrator PC (which is connected to the device through wired or wireless) IP settings will use different address space, the device will become unreachable.

**Netmask:** This is used to define the device IP classification for the chosen IP address range. 255.255.255.0 is a typical netmask value for Class C networks, which support IP address range 192.0.0.x to 223.255.255.x. Class C network Netmask uses 24 bits to identify the network (alternative notation "/24") and 8 bits to identify the host.

**Gateway IP:** This is the IP address of the host router which resides on the external network and provides the point of connection to the next hop towards the internet. This can be a DSL modem, Cable modem, or a WISP gateway router. The device will direct all the packets to the gateway if the destination host is not within the local network.

Gateway IP address should be from the same address space (on the same network segment) as the device's external network interface (Wireless interface in the Station case and the LAN interface in the AP case).

**Primary/Secondary DNS IP:** The Domain Name System (DNS) is an internet "phone book" which translates domain names to IP addresses. These fields identify the server IP addresses where the DNS requests are forwarded by the device.

Primary DNS server IP is mandatory. It is used by the DNS Proxy and for the device management purpose.

Secondary DNS server IP address is optional. It is used as the fail-over in case the primary DNS server will become unresponsive.

**Enable NAT:** Network Address Translation (NAT) enables packets to be sent from the wired network (LAN) to the wireless interface IP address and then sub-routed to other client devices residing on it's local network while the device is operating in AP/AP WDS wireless mode and in the contrariwise direction in "Station/Station WDS" mode.

NAT is implemented using the masquerade type firewall rules. NAT firewall entries are stored in the iptables nat table, while the device is operating in Router mode. Please refer to the iptables tutorial for detailed description of the NAT functionality in Router mode.

Static routes should be specified in order the packets should pass-through the based device if the NAT is disabled in while operating in Router network mode.

**Enable DHCP Server:** Dynamic Host Configuration Protocol (DHCP) Server assigns IP addresses to clients which will associate to the wireless interface while the device is operating in AP/AP WDS wireless mode and assigns IP addresses to clients which will connect to the LAN interface while the device is operating in Station/Station WDS mode.

**Range Start/End:** This range determines the IP addresses given out by the DHCP server to client devices on the internal network which use dynamic IP configuration.

**Lease Time:** The IP addresses given out by the DHCP server will only be valid for the duration specified by the lease time. Increasing the time ensure client operation without interrupt, but could introduce potential conflicts. Lowering the lease time will avoid potential address conflicts, but might cause more slight interruptions to the client while it will acquire new IP addresses from the DHCP server.

## Port Forwarding Settings

**Port Forwarding:** Port forwarding allows specific ports of the hosts residing in the internal network to be forwarded to the external network. This is useful for number of applications such as FTP servers, gaming, etc. where different host systems need to be seen using a single common IP address/port. Port Forwarding rules can be set in Port Forwarding window, which is opened by enabling the Port Forwarding option and activating the Configure button.

Port Forwarding entries can be specified by using the following criteria:

**Private IP** is the IP of the host which is connected to the internal network and needs to be accessible from the external network;

**Private Port** is the TCP/UDP port of the application running on the host which is connected to the internal network. The specified port will be accessible from the external network;

**Type** is the L3 protocol (IP) type which needs to be forwarded from the internal network.

Public Port is the TCP/UDP port of the based device which will accept and forward the connections from the external network to the host connected to the internal network.

**Comments** is the informal field for the comment of the particular port forwarding entry.

Few words about the particular port forwarding entry purpose are saved there usually.

Enabled flag enables or disables the effect of the particular port forwarding entry.

All the added firewall entries are saved in system configuration file, however only the enabled port forwarding entries will be active during the system operation.

New entries in port forwarding can be saved by activating Save button or discarded by activating Cancel button in the Port Forwarding configuration window.

**DNS Proxy:** The DNS Proxy forwards the Domain Name System requests from the hosts which reside in the internal network to the DNS server while device is in operating in Router mode. Valid Primary DNS Server IP needs to be specified for DNS Proxy functionality. Internal network interface IP of the device should be specified as the DNS server in the host configuration in order DNS Proxy should be able to get the DNS requests and translate domain names to IP addresses afterwards.

## Bridge mode Firewall Configuration Settings

**Firewall** functionality on any router interface can be enabled using the "Enable Firewall" option.

Router Firewall rules can be configured, enabled or disabled while using Firewall configuration window which is opened with the "Configure" button.

Firewall entries can be specified by using the following criteria:

**Interface** the interface (WLAN, LAN or PPP) where filtering of the incoming/passing-through packets is processed;

**IP Type** sets which particular L3 protocol type (ICMP, TCP, UDP, P2P) should be filtered;

**Source IP/mask** is the source IP of the packet (specified within the packet header), usually it is the IP of the host system which sends the packets;

**Source Port** is the source port of the TCP/UDP packet (specified within the packet header), usually it is the port of the host system application which sends the packets;

**Destination IP/mask** is the destination IP of the packet (specified within the packet header), usually it is the IP of the system which the packet is addressed to;

**Destination Port** is the destination port of the TCP/UDP packet (specified within the packet header), usually it is the port of the host system application which the packet is addressed to.

**Comments** is the informal field for the comment of the particular firewall entry. Few words about the particular firewall entry purpose are saved there usually.

**On flag** enables or disables the effect of the particular firewall entry. All the added firewall entries are saved in system configuration file, however only the enabled firewall entries will be active during device operation.

New entries in Firewall can be saved by activating Apply Setting and Save Changes button or discarded by activating Cancel button in the Firewall configuration window.

All the active firewall entries are stored in the FIREWALL chain of the iptables filter table, while the device is operating in Router mode.

**PPPoE:** Point-to-Point Protocol over Ethernet (PPPoE) is a virtual private and secure connection between two systems which enables encapsulated data transport. It is commonly used as the medium for subscribers to connect to Internet Service Providers.

Select the IP Address option PPPoE to configure a PPPoE tunnel in order to connect to an ISP.

Only the external network interface can be configured as PPPoE client as all the traffic will be sent via this tunnel. The IP address, Default gateway IP and DNS server IP address will be obtained from the PPPoE server after PPPoE connection is established. Broadcast address is used for the PPPoE server discovery and tunnel establishment.

Valid authorization credentials are required for the PPPoE connection:

**PPPoE Username** – username to connect to the server (must match the configured on the PPPoE server);

**Password** – password to connect to the server (must match the configured on the PPPoE server);

**PPPoE MTU/MRU** – the size (in bytes) of the Maximum Transmission Unit (MTU) and Maximum Receive Unit (MRU) used for the data encapsulation while transferring it through the PPP tunnel;

**Enable DMZ:** The Demilitarized zone (DMZ) can be enabled and used as a place where services can be placed such as Web Servers, Proxy Servers, and E-mail Servers such that these services can still serve the local network and are at the same time isolated from it for additional security. DMZ is commonly used with the NAT functionality as an alternative for the Port Forwarding while makes all the ports of the host network device be visible from the external network side.

**DMZ Management Port:** Web Management Port for the based device (TCP/IP port 80 by default) will be used for the host device if DMZ Management Port option is enabled. In this case device will respond to the requests from the external network as if it was the host which is specified with DMZ IP. It is recommended to leave Management Port disabled while the based device will become inaccessible from the external network if enabled.

**DMZ IP:** connected to the internal network host, specified with the DMZ IP address will be accessible from the external network.

With a multicast design, applications can send one copy of each packet and address it to the group of computers that want to receive it. This technique addresses packets to a group of receivers rather than to a single receiver. It depends on the network to forward the packets to the hosts which need to receive them. Common Routers isolate all the broadcast (thus multicast) traffic between the internal and external networks, however provides the multicast traffic pass-through functionality.

Click Change button to save the changes made in the Network page.

# Appendix III- Services

This section provides more details on the system management services.

## Ping WatchDog

The ping watchdog sets the device to continuously ping a user defined IP address (it can be the internet gateway for example). If it is unable to ping under the user defined constraints, the device will automatically reboot. This option creates a kind of "fail-proof" mechanism.

Ping Watchdog is dedicated for continuous monitoring of the particular connection to remote host using the Ping tool. The Ping works by sending ICMP "echo request" packets to the target host and listening for ICMP "echo response" replies. If the defined number of replies is not received, the tool reboots the device.

**Enable Ping Watchdog:** control will enable Ping Watchdog Tool.

**IP Address To Ping:** enter the target host IP address to monitor.

**Ping Interval:** specify time interval (in seconds) between to send the ICMP "echo requests".

**Startup Delay:** specify initial time delay (in seconds) from device startup or reboot to start sending first ICMP "echo requests". Minimum value is 60 seconds.

**Failure Count To Reboot:** specify the number of ICMP "echo response" replies. If the specified number of ICMP "echo response" packets is not received continuously, the Ping Watchdog Tool will reboot the device.

## SNMP Agent

Simple Network Monitor Protocol (SNMP) is used in network management systems to monitor network-attached devices for conditions that warrant administrative attention. Device contains an SNMP agent which allows it to communicate to SNMP manage applications for network provisioning.

SNMP Agent provides an interface for device monitoring using the Simple Network Management Protocol (an application layer protocol that facilitates the exchange of management information between network devices). SNMP Agent allows network administrators to monitor network performance, find and solve network problems. For the purpose of equipment identification, it is always a good idea to configure SNMP agents with contact and location information:

**Enable SNMP Agent:** control will enable SNMP Agent.

**SNMP Community:** specify SNMP community string. It is required to authenticate access to MIB objects and functions as embedded password. The device supports a Read-only community string that gives read access to authorized management stations to all the objects in the MIB except the community strings, but does not allow write access for device that supports SNMP v1.

**Contact:** specify the identity or contact in case an emergency situation arise.

**Location:** specify the physical location of the device.

## **NTP Client, Web, Telnet, SSH Server**

**NTP Client:** The Network Time Protocol (NTP) is a protocol for synchronizing the clocks of computer systems over packet-switched, variable-latency data networks. It can be used to set the device system time. System Time is reported next to the every System Log entry while registering system events if Log option is enabled.

**Web Server:** the following the device Web Server parameters can be set there:

**Use Secure Connection (HTTPS):** If checked Web server will use secure HTTPS mode. HTTP mode is selected by default.

**Secure Server Port:** Web Server TCP/IP port setting while using HTTPS mode.

**Server Port:** Web Server TCP/IP port setting while using HTTP mode.

**Telnet Server:** the following the device Telnet Server parameters can be set there:

**Enable Telnet Server:** Enables Telnet access to the device.

**Server Port:** Telnet service TCP/IP port setting.

**SSH Server:** the following the device SSH Server parameters can be set there:

**Enable SSH Server:** Enables SSH access to the device.

**Server Port:** SSH service TCP/IP port setting.

## **System Log**

**Enable Log :** option enables the registration routine of the system log messages.

Enable Remote Log enables the syslog remote sending function while System log messages are sent to a remote server specified by the Remote Log IP Address and Remote Log Port.

**Remote Log IP Address** is the host IP address where syslog messages should be sent. Remote host should be configured properly to receive syslog protocol messages.

**Remote Log Port** is the TCP/IP port of the host syslog messages should be sent. "514" is the default port for the commonly used system message logging utilities

Every logged message contains at least a *System Time* and a Host Name. Usually a particular service name which generates the system event is specifies also within the message. Messages from different services have different context and different level of the details. Usually *error*, *warning* or *informational* system services messages are reported. The more detailed system messages are reported, the greater volume of log messages will be generated.

# Appendix IV- VLAN Setup examples

## A) Tagged Wireless VLAN to Tagged Ethernet VLAN Setup

### Tag vlan connection Setup

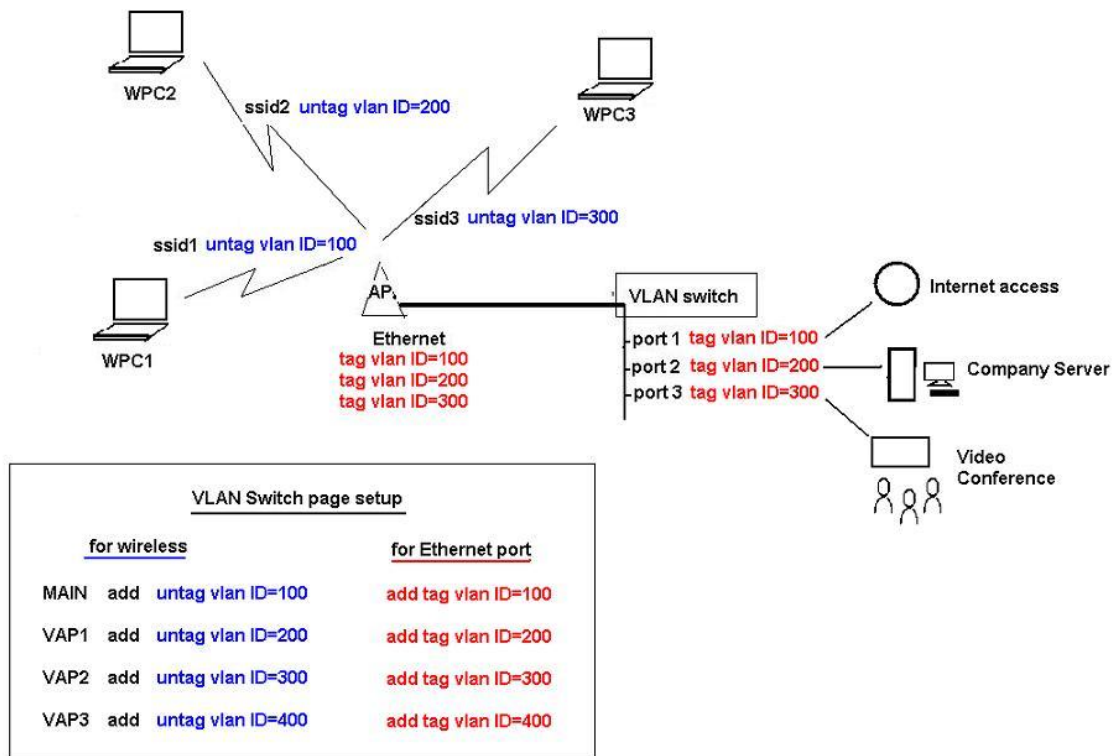

Hints:-

For each vlan id group to send between AP and wireless clients,  
 AP wlan and ethernet interface must add that vlan group.  
 AP ethernet port connecting to the switch must set to the default vlan id same as switch port its connecting.

## B) Untagged Wireless VLAN to Tagged Ethernet VLAN setup

Multi-SSID with untag vlan connections to secured wired tag vlan network connections

## C) Tagged VLAN Pass-Through

AP and Station link No VLAN Setup

Required

Tagged VLAN pass-through. AP and Station link no VLAN Setup Required

\* - AP and Station devices no VLAN setting required
