## Stat Version 2 (RTSv2) Permissive Change Request

### Description of changes

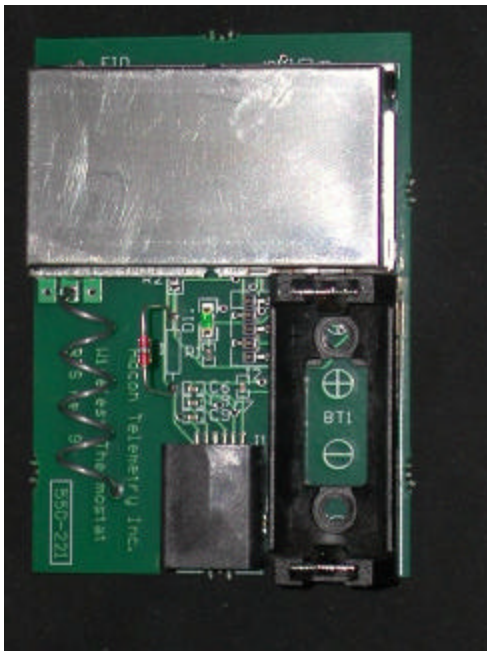

The changes involve the addition of two features to the motherboard.

The two additional features are a mechanical slider (“Setpoint”) which permits the user to set the desired temperature, and a pushbutton (“Override”) which permits the user to override the current settings.

To accommodate these changes, the layout of the motherboard was changed, however *the radio module and its transmission characteristics were not modified in any way.*

The changes involved the addition of seven resistors to the motherboard (R6-R12, see schematic), as well as the mechanical slider and pushbutton. No other components were added, removed, or changed.
