

(5) Country code selection ability - Yes, No

If yes, please explain how it was implemented: (please also help to provide detail of options for each country selection)

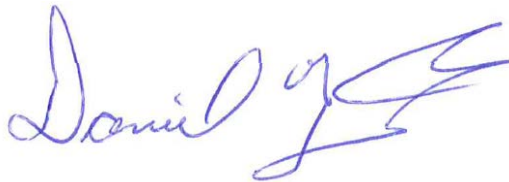

Products shipped in the U.S. are defaulted to the U.S. country code. Within that country code, the user can select only the frequency bands that are authorized by and certified to the rules of the FCC in terms of supported frequencies, transmit power, and radar mode.

The country codes available on products shipped in the U.S. is restricted to the U.S. code and other country codes which utilize the same rules, or use a more restrictive set of rules than the U.S. (e.g. Canada, Guam, US Virgin Islands). Said another way, there is no manner by which a user can configure the product to violate Part 15 FCC rules.

(6) For client devices that have software configuration control to operate in different modes (active scanning in some and passive scanning in others) in different bands (devices with multiple equipment classes or those that operate on non-DFS frequencies) or modular devices which configure the modes of operations through software, the application must provide software and operations description on how the software and /or hardware is implemented to ensure that proper operations modes cannot be modified by end user or an installer.

Apply, Not Apply, (If apply, please help to provide explanation on it was implement, and how software was controlled)

Sincerely yours,

Client's name & title: Daniel Tousignant
