4.5 Mode of operation during the test

The EUT was tested as following 2 modes for getting maximum emission levels from the EUT, but the worst emissions were recorded in this test report.

- 1. Normal operation Mode: The EUT was set to wireless microphone and then stored image and sound in the EUT was continuously displayed on the screen of the TV during the testing.
- 2. Set signal generator at 798.375MHz and 799.125MHz and then EUT received the CW signal for coherent testing.

4.6 Configuration of Test System

Line Conducted Emission Test:

The receiver was connected to LISN. All supporting equipments were connected to another LISN. Preliminary Power line Conducted Emission test was performed by using the procedure in ANSI C63.4: 2003 7.2.3 to determine the worse operating conditions.

It is not need to test this requirement, because the power of the EUT supplies from a car battery.

Radiated Emission Test:

Preliminary radiated emissions tests were conducted using the procedure in ANSI C63.4/2003, 8.3.1.1 to determine the worse operating conditions. Final radiated emission tests were conducted at 3 meters open area test site.

Coherent Test:

During Radiated Emission Tests, H.P. signal generator model no: 8657A was used to radiate an unmodulated CW signal to EUT at 798.375 MHz and 799.125 MHz in order to cohere the individual components of the characteristic broadband emissions from EUT.

Antenna Power Conduction Test:

This equipment was only with a permanently attached antenna, so the radiated emission measurement was performed with the antenna attached.

5. PRELIMINARY TEST
