FCC ID: TQ8-FOB-4F34

According to KDB 447498 D01 General RF Exposure Guidance v06.

At 100 ㎒ to 6 ㎓ and for test separation distances ≤ 50 ㎜, the SAR test exclusion threshold is determined according to the following.

[(max. power of channel, including tune-up tolerance, ㎽) / (min. test separation distance, ㎜)]
x [√f(㎓)] ≤ 3.0

1. SAR test exclusion threshold
Frequency: 433.92 ㎒ (min. separation distances = 0 ㎜)

Calculation value: 0.1 (㎽) / 5 (㎜) x √ 0.433 92 = 0.013
So, Calculation value ≤ 3.0

Remark:
-Max. Radiated field strength 77.37 (dB㎌): Max. E.I.R.P. of EUT (-17.86 dBm)
-Max. E.I.R.P. 0.016 (㎽) is less than 0.1 (㎽), so 0.1 (㎽) was calculated.
-When the minimum test separation distance is < 5 ㎜, a distance of 5 ㎜ is applied to determine SAR test exclusion.

2. Conclusion: No SAR is required.
