FCC ID: TQ8-FOB-4F36

According to KDB 447498 D01 General RF Exposure Guidance v06.

At 100 MHz to 6 GHz and for test separation distances \leq 50 nm, the SAR test exclusion threshold is determined according to the following.

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] x [$\sqrt{f(Ghz)}$] ≤ 3.0

1. SAR test exclusion threshold Frequency: 433.92 ₩ (min. separation distances = 0 mm)

Calculation value: 0.1 (mW) / 5 (nm) x $\sqrt{0.43392} = 0.013$ So, Calculation value ≤ 3.0

Remark;

- Max. Radiated field strength 78.55 (dBµN): Max. E.I.R.P. of EUT (-16.68 dBm)

- Max. E.I.R.P. 0.021 (mW) is less than 0.1 (mW), so 0.1 (mW) was calculated.

- When the minimum test separation distance is < 5 m, a distance of 5 m is applied to determine SAR test exclusion.

2. Conclusion: No SAR is required.
