## FCC ID: TQ8-RKE-4F43

According to KDB 447498 D01 General RF Exposure Guidance v06.

At 100 MHz to 6 GHz and for test separation distances $\leq 50 \mathrm{~mm}$, the SAR test exclusion threshold is determined according to the following.
[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] $x[\mathrm{Vf}(\mathrm{CHz})] \leq 3.0$

## 1. SAR test exclusion threshold <br> Frequency: 433.92 MHz (min. separation distances = 0 mm )

Calculation value: $0.017(\mathrm{~mW}) / 5(\mathrm{~mm}) \times \sqrt{ } 0.43392=0.002$
So, Calculation value $\leq 3.0$

Remark;

- Max. Radiated field strength $77.44(\mathrm{~dB} \mu \mathrm{~V} / \mathrm{m})$ : Max. E.I.R.P. of EUT - $17.79 \mathrm{dBm}(0.017 \mathrm{~mW})$
- When the minimum test separation distance is $<5 \mathrm{~mm}$, a distance of 5 mm is applied to determine SAR test exclusion.

## 2. Conclusion: No SAR is required.
