## SAR Exclusion Letter

Date of Issue: May 04, 2016

According to KDB 447498 D01 v06 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance  $\leq$  50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] \*·[ $\sqrt{f(GHz)}$ ]  $\leq 3.0$ 

The tune-up power is 2.94 dBm +/- 0dB, therefore the highest tune-up power is

2.94 dBm (1.9679 mW) @ 2441 MHz

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So.

 $(1.9679 \text{mW} / 5 \text{mm}) * (2.441 \text{GHz} ^0.5) = 0.615$ 

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] \*  $[\sqrt{f(GHz)}] = 0.615 < 3.0$ 

Therefore, SAR are not required
