Revisions

Revision 1 Issued July 17, 2018

Forward

The following information is submitted as documentation of compliance with regulations supporting Class 2 Permissible Change of Authorized Equipment. This product was authorized under Digital transmission system equipment per 47 CFR Paragraph 15.247, Industry Canada RSS-247 Issue 2 and RSS-GEN, operating in the 2412 – 2462 MHz frequency band. The module was originally Granted with restrictions for co-located with other transmitters. This Class 2 Permissible Change request supports processing as limited modular authorization for use in the configuration documented in this filing. Supporting operation as a co-located module configuration as documented in this filing.

Name of Applicant: Mikrotikls SIA

Radiated Emissions	Complies

Change to Equipment from Original Design

This request addresses use of the module in the co-located configuration documented in this report. The information contained in this report addresses use as a limited modular configuration with a co-located transmitter operating in the 5 GHz frequency band. No modifications in the transmitter circuitry were required. The transmitter remains electrically identical and functionally equivalent to the original equipment authorization.

Equipment Tested

Equipment	Model	FCC ID:
EUT	R11e-2HPnD	TV7R11E2HPND
Support Enclosure	RB4011iGS+5HacQ2HnD-IN	TV7R11E2HPND
AC Adapter	WT-2402500	N/A
Dell Studio XPS	921LBN1	N/A
Support interface Board	RB 3011UiAS-2HnD	N/A

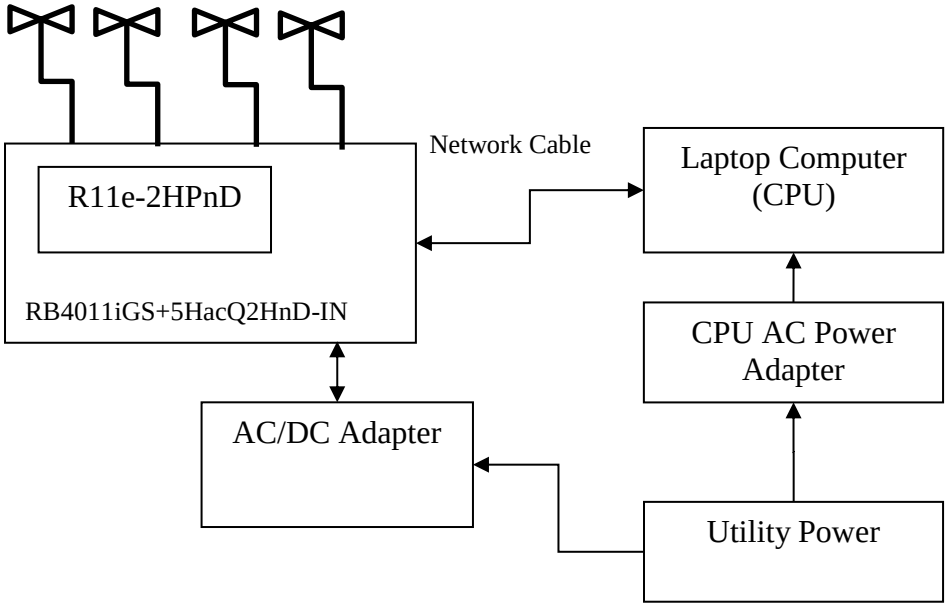
Test results in this report relate only to the items tested.

Equipment Function

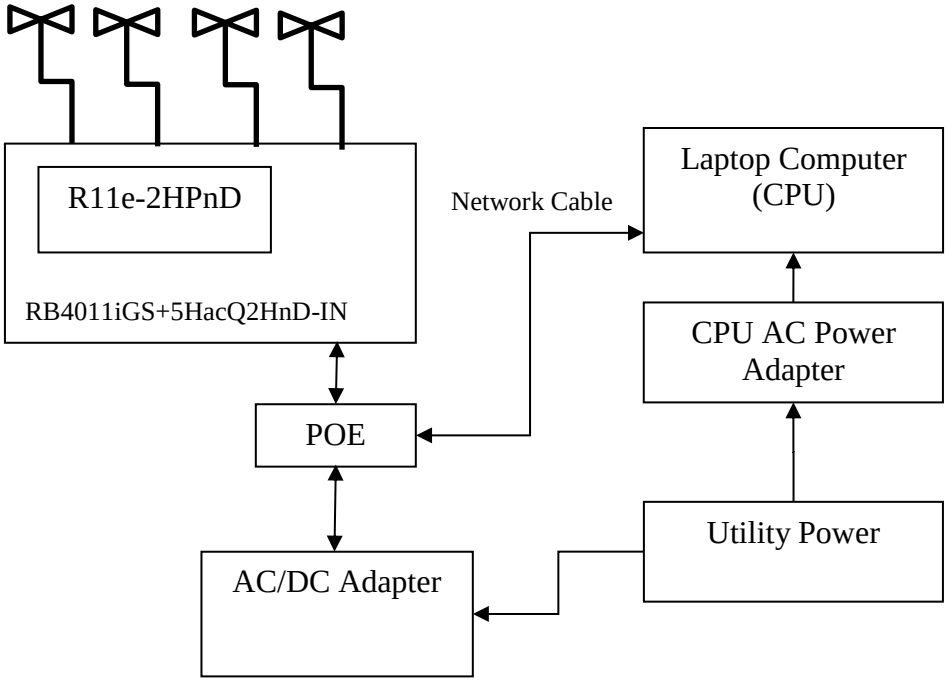
The EUT is a 2412-2462 MHz 2x2 MIMO Digital Transmission System module used to transmit data in applications offering broadband wireless connectivity. The design provides MMCX antenna connection ports for use with the Omni directional antenna. The equipment provides a wireless link for exchanging data information from one point to another. For testing purposes, the R11e-2HPnD transceiver was placed in the manufacturer provided enclosure containing a 5 GHz MIMO transceiver system. This test configuration was configured to communicate to a laptop computer through Ethernet network interface for communications and control. This configuration offered operational control of the system and communications over the network interface between the EUT and supporting computer system. For testing purposes, the test system received power from the AC Adapter and Power Over Ethernet (POE) supporting system. Radiated emission testing was performed to confirm any intermodulation products remained complaint with the regulations and requirements.

Equipment Configuration

Configuration #1 Powered from AC/DC Adapter



Configuration #2 POE



Application for Certification

(1) Manufacturer: Mikrotikls SIA
Brivibas gatve 214i
Riga Latvia LV-1039

(2) Identification: Model: R11e-2HPnD

FCC ID: TV7R11E2HPND IC: 7442A-R11E2HPND

(3) Instruction Book:

Refer to Exhibit for Instruction Manual.

(4) Description of Circuit Functions:

Refer to Exhibit of Operational Description.

(5) Block Diagram with Frequencies:

Refer to Exhibit of Operational Description.

(6) Report of Measurements:

Report of measurements follows in this Report.

(7) Photographs: Construction, Component Placement, etc.:

Refer to Exhibit for photographs of equipment.

(8) List of Peripheral Equipment Necessary for operation. The module operates from power received from the supporting motherboard and interface. During testing, the module was incorporated in the RB4011iGS+5HacQ2HnD-IN enclosure provided the support interface and connection to a CPU through network cable.

(9) Transition Provisions of CFR47 15.37 are not requested.

(10) Not Applicable. The unit is not a scanning receiver.

(11) Not Applicable. The EUT does not operate in the 59 – 64 GHz frequency band.

(12) The equipment is not software defined and this section is not applicable.

(13) Applications for certification of U-NII devices in the 5.15-5.35 GHz and the 5.47-5.85 GHz bands must include a high-level operational description of the security procedures that control the radio frequency operating parameters and ensure that unauthorized modifications cannot be made. This requirement is not applicable to his DTS device.

(14) Contain at least one drawing or photograph showing the test set-up for each of the required types of tests applicable to the device for which certification is requested. These drawings or photographs must show enough detail to confirm other information contained in the test report. Any photographs used must be focused originals without glare or dark spots and must clearly show the test configuration used. This information is provided in this report and Test Setup Exhibits provided with the application filing.

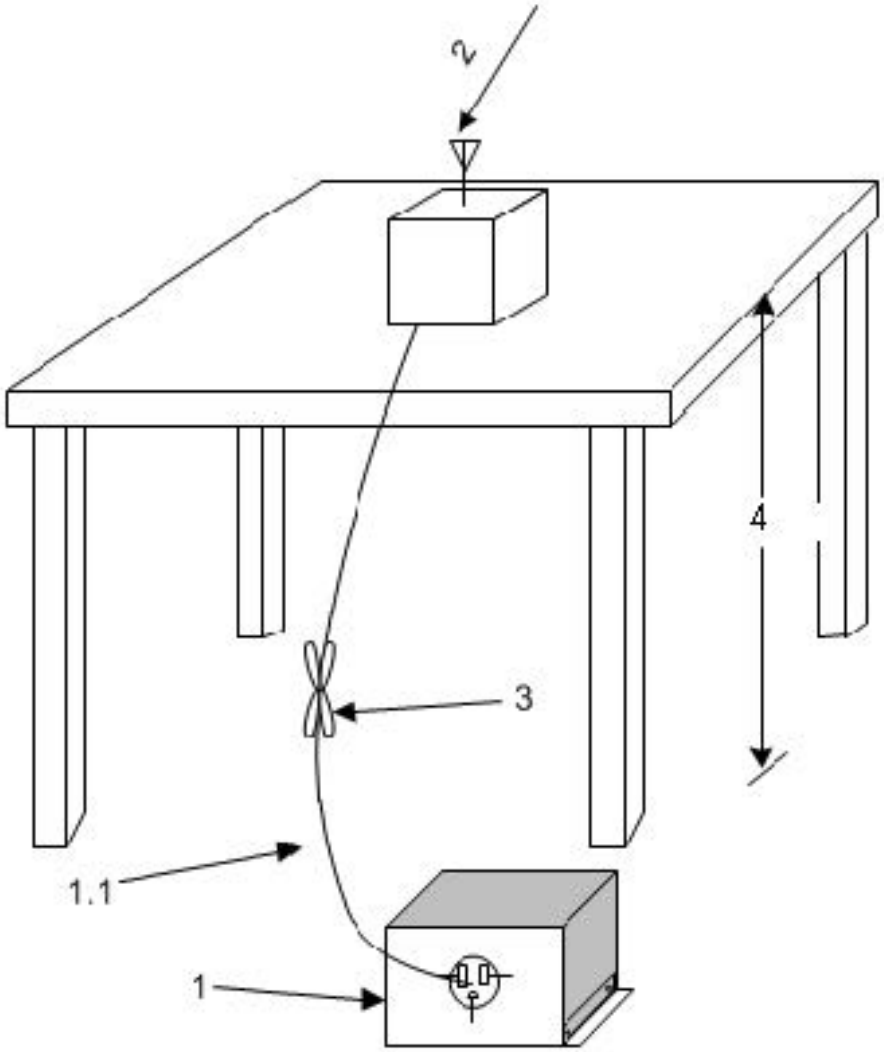
Applicable Standards & Test Procedures

In accordance with the Federal Communications Code of Federal Regulations, Title 47 (47CFR) dated May 15, 2018: Part 2, Subpart J, Paragraphs 2.1043, applicable parts of paragraph 15C, KDB 178919 D01 Permissive Change Policy v06, Industry Canada RSS-247 Issue 2, and RSS-GEN Issue 5 operation in the 2400 – 2483.5 MHz Frequency band. Test procedures used are the established Methods of Measurement of Radio-Noise Emissions as described in ANSI C63.10-2013.

Equipment Testing Procedures

Radiated Emission Test Procedure

The EUT was placed on a rotating 0.9 x 1.2-meter platform, elevated as required above the ground plane at a distance of 3 meters from the FSM antenna. Radiated emissions testing was performed as required in the regulations and specified in ANSI C63.10-2013. EMI energy was maximized by equipment placement permitting orientation in three orthogonal axes, raising and lowering the FSM antenna, changing the antenna polarization, and by rotating the turntable. Each emission was maximized before data was taken and recorded. The frequency spectrum from 9 kHz to 25,000 MHz was searched for emissions during preliminary investigation. Refer to diagrams one and two showing typical test setup. Refer to photographs in the test setup exhibits for specific EUT placement during testing.



1—A LISN is optional for radiated measurements between 30 MHz and 1000 MHz but not allowed for measurements below 30 MHz and above 1000 MHz (see 6.3.1). If used, then connect EUT to one LISN. Unused LISN measuring port connectors shall be terminated in 50 Ω loads. The LISN may be placed on top of, or immediately beneath, the reference ground plane (see 6.2.2 and 6.2.3.2).
1.1—LISN spaced at least 80 cm from the nearest part of the EUT chassis.
2—Antenna can be integral or detachable, depending on the EUT (see 6.3.1).
3—Interconnecting cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle 30 cm to 40 cm long (see 6.3.1).
4—For emission measurements at or below 1 GHz, the table height shall be 80 cm. For emission measurements above 1 GHz, the table height shall be 1.5 m for measurements, except as otherwise specified (see 6.3.1 and 6.6.3.1).

Units of Measurements

Conducted EMI Data is in dBµV; dB referenced to one microvolt

Radiated EMI Data is in dBµV/m; dB/m referenced to one microvolt per meter

Sample Calculation:

RFS = Radiated Field Strength, FSM = Field Strength Measured

A.F. = Receive antenna factor, Gain = amplification gains and/or cable losses

RFS (dBµV/m @ 3m) = FSM (dBµV) + A.F. (dB) - Gain (dB)

Environmental Conditions

Ambient Temperature	23.6° C
Relative Humidity	39%
Atmospheric Pressure	1012.8 mb

Statement of Modifications and Deviations

No modifications to the EUT were required during investigation for the equipment to demonstrate compliance with the 47CFR, Part 2.1043, Part 15C, Industry Canada RSS-247 Issue 2, and RSS-GEN Issue 5 emission requirements. There were no deviations to the specifications.

Intentional Radiators

The following information is submitted in support of demonstration of compliance with the requirements of 47CFR Parts 2 and 15C, Class 2 permissible change, Industry Canada RSS-247 Issue 2 and RSS-GEN Issue 5.

Antenna Requirements

The EUT incorporates integral antenna system and production units offer no provision for connection to alternate antenna system. The antenna connection point complies with the unique antenna connection requirements. The unique antenna connection requirements are fulfilled. There are no deviations or exceptions to the specification.

General Radiated Emissions Procedure

The EUT was arranged in a typical equipment configuration and operated through available modes during testing. Preliminary testing was performed in a screen room with the EUT positioned 1 meter from the FSM. Radiated emissions measurements were performed to identify the frequencies, which produced the highest emissions. Each radiated emission was then maximized at the OATS location before final radiated measurements were performed. Final data was taken with the EUT located at the OATS at a distance of 3 meters between the EUT and the receiving antenna. The frequency spectrum from 9 kHz to 25,000 MHz was searched for general radiated emissions. Measured emission levels were maximized by EUT placement on the table, rotating the turntable through 360 degrees, varying the antenna height between 1 and 4 meters above the ground plane and changing antenna position between horizontal and vertical polarization. Antennas used were Loop from 9 kHz to 30 MHz, Broadband Biconical from 30 to 200 MHz, Biconilog from 30 to 1000 MHz, Log Periodic from 200 MHz to 1 GHz and or double Ridge or pyramidal horns and mixers above 1 GHz, notch filters and appropriate amplifiers and external mixers were utilized.

Table 1 General Radiated Emissions Data

Frequency in MHz	Horizontal Peak (dBµV/m)	Horizontal Quasi-Peak (dBµV/m)	Horizontal Average (dBµV/m)	Vertical Peak (dBµV/m)	Vertical Quasi-Peak (dBµV/m)	Vertical Average (dBµV/m)	Limit @ 3m (dBµV/m)

750.0	52.3	45.9	N/A	51.8	45.2	N/A	46.0

Other emissions present had amplitudes at least 20 dB below the limit. Peak and Quasi-Peak amplitude emissions are recorded for frequency range below 1000 MHz. Peak and Average amplitude emissions are recorded for frequency range above 1000 MHz.

Summary of Results for General Radiated Emissions

The EUT demonstrated compliance with the radiated emissions requirements of CFR47 Part 15C paragraph 15.209, RSS-247 and RSS-GEN Intentional Radiators. The EUT demonstrated a minimum margin of -0.1 dB below the requirements. Other emissions were present with amplitudes at least 20 dB below the Limits.

Annex A Measurement Uncertainty Calculations

Measurement uncertainty calculations were made for the laboratory. Result of measurement uncertainty calculations are recorded below for AC line conducted and radiated emission measurements.

Measurement Uncertainty	$U_{(E)}$	$U_{(lab)}$
3 Meter Horizontal 30-200 MHz Measurements	2.08	4.16
3 Meter Vertical 30-200 MHz Measurements	2.16	4.33
3 Meter Vertical Measurements 200-1000 MHz	2.99	5.97
10 Meter Horizontal Measurements 30-200 MHz	2.07	4.15
10 Meter Vertical Measurements 30-200 MHz	2.06	4.13
10 Meter Horizontal Measurements 200-1000 MHz	2.32	4.64
10 Meter Vertical Measurements 200-1000 MHz	2.33	4.66
3 Meter Measurements 1-6 GHz	2.57	5.14
3 Meter Measurements 6-18 GHz	2.58	5.16
AC Line Conducted	1.72	3.43

Annex C Rogers Qualifications

Scot D. Rogers, Engineer

Rogers Labs, Inc.

Mr. Rogers has approximately 27 years' experience in the field of electronics. Engineering experience includes six years in the automated controls industry and remaining years working with the design, development and testing of radio communications and electronic equipment.

Positions Held

Systems Engineer:	A/C Controls Mfg. Co., Inc.	6 Years
Electrical Engineer:	Rogers Consulting Labs, Inc.	5 Years
Electrical Engineer:	Rogers Labs, Inc.	Current

Educational Background

1) Bachelor of Science Degree in Electrical Engineering from Kansas State University.

2) Bachelor of Science Degree in Business Administration Kansas State University.

3) Several Specialized Training courses and seminars pertaining to Microprocessors and Software programming.
