Application for Certification

- Manufacturer: Mikrotikls SIA
 Pernavas 46
 Riga, Latvia LV-1009
- (2) Identification: Model: RB951Ui-2HnD

FCC I.D.: TV7RB951U-2HND

(3) Instruction Book:

Refer to Exhibit for Instruction Manual.

(4) Description of Circuit Functions:

Refer to Exhibit of Operational Description.

(5) Block Diagram with Frequencies:

Refer to Exhibit of Operational Description.

(6) Report of Measurements:

Report of measurements follows in this Report.

(7) Photographs: Construction, Component Placement, etc.:

Refer to Exhibit for photographs of equipment.

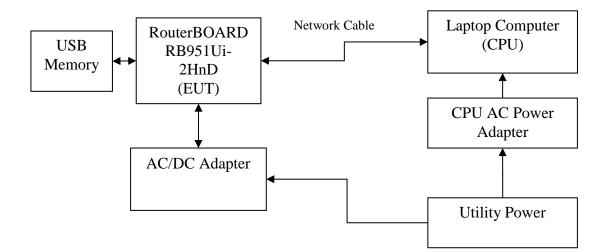

- (8) List of Peripheral Equipment Necessary for operation. The equipment operates from power received from authorized AC/DC power adapter. The EUT provides five Ethernet ports, one USB 2.0 port, and DC input power port for operation. During testing, the EUT was connected to CPU through network cable. The EUT received power supplied from external AC/DC supply.
- (9) Transition Provisions of CFR47 15.37 are not requested.
- (10) Not Applicable. The unit is not a scanning receiver.
- (11) Not Applicable. The EUT does not operate in the 59 64 GHz frequency band.
- (12) The equipment is not software defined and this section is not applicable.

Equipment Function and Configuration

The EUT is a 2412-2462 MHz 2x2 MIMO Digital Transmission System used to transmit data in applications offering broadband wireless connectivity. The design utilizes internal fixed antenna system and offers no provision for antenna replacement or modification. The equipment is marketed for use to incorporate a wireless link to exchange data information from one point to another. For testing purposes, the RB951Ui-2HnD transceiver was connected to the manufacturer supplied AC/DC supply and communicating to the laptop computer through Ethernet network interface. This configuration offered operational control of the transmitter and communications over the network interface between the EUT and supporting computer system. The EUT offers five Ethernet network interface ports, one USB interface port and requires power supplied from external source AC/DC adapter. No other interfacing options are provided. For testing purposes, the RB951Ui-2HnD received powered from the AC/DC supply and was configured to transmit in available data modes. The device is produced with integral antenna system only. The antenna system complies with requirements for unique antenna connection port.

Equipment Configuration

Applicable Standards & Test Procedures

In accordance with the Federal Communications Code of Federal Regulations, dated October 1, 2012, Part 2, Subpart J, Paragraphs 2.907, 2.911, 2.913, 2.925, 2.926, 2.1031 through 2.1057, and applicable parts of paragraph 15, Part 15C Paragraph 15.247 the following information is submitted. Test procedures used are the established Methods of Measurement of Radio-Noise Emissions as described in ANSI C63.4-2009, ANSI C63.10-2009, KDB 558074 D01 v03r1, KDB 662911 D01 Multiple Transmitter Output v02, KDB 662911 D02 MIMO with Cross Polarized Antenna v01, and KDB 913591. Testing for the AC line-conducted emissions were performed as defined in sections 7 and 13.1.3, testing of the radiated emissions was performed as required including procedures in section 13 of ANSI C63.4-2009.

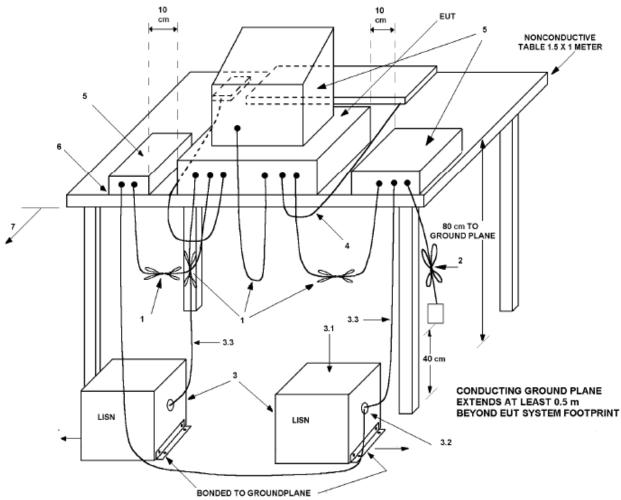

Equipment Testing Procedures AC Line Conducted Emission Test Procedure

For testing purposes, the manufacturer supplied AC/DC power adapter was used to power the EUT. Testing for the AC line-conducted emissions testing was performed as defined in sections 7 and 13.1.3 of ANSI C63.4-2009. The test setup including the EUT was arranged in typical equipment configurations and placed on a 1 x 1.5-meter wooden bench, 0.8 meters high located in a screen room. The power lines of the system were isolated from the power source using a standard LISN with a 50- μ Hy choke. EMI was coupled to the spectrum analyzer through a 0.1 μ F capacitor internal to the LISN. The LISN was positioned on the floor beneath the wooden bench supporting the EUT. The power lines and cables were draped over the back edge of the table. Refer to diagram 1 showing typical test arrangement and photographs in the test setup exhibits for Specific EUT placement during testing. Refer to photographs in the test setup exhibits for EUT placement during testing.

Diagram 1 Test arrangement for Conducted emissions

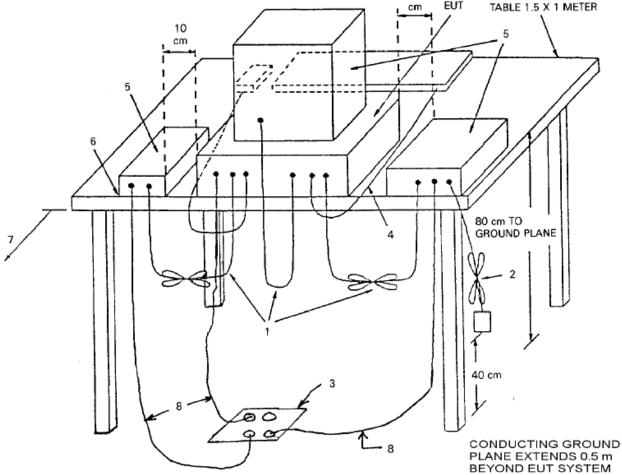

- 1. Interconnecting cables that hang closer than 40 cm to the ground plane were folded back and forth in the center forming a bundle 30 cm to 40 cm long.
- 2. Input/output (I/O) cables that are not connected to a peripheral shall be bundled in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m.
- 3. EUT connected to one LISN. Unused LISN measuring port connectors are terminated into 50 Ω loads. LISN is placed on top of and bonded to reference ground plane.
- 3.1 All other equipment powered from additional LISN(s).
- 3.2 Multiple outlet strips can be used for multiple power cords of non-EUT equipment.
- 3.3 LISN is positioned at least 80 cm from nearest part of EUT chassis.
- 4. Cables of hand-operated devices, such as keyboards, mice, and so on, shall be placed as for normal use.
- 5. Non-EUT components of EUT system being tested.
- 6. Rear of EUT, including peripherals, shall all be aligned and flush with rear of tabletop.
- 7. Rear of tabletop shall be 40 cm removed from a vertical conducting plane that is bonded to the ground plane (see 5.2.2 for options).

Rogers Labs, Inc.Mikrotikls SIA4405 W. 259th TerraceModel: RB951Ui-2HnDSN: 42B901DDA60Louisburg, KS 66053Test #: 130317FCC ID#: TV7RB951U-2HNDPhone/Fax: (913) 837-3214Test to: CFR47 (15.247)Date: September 9, 2013Revision 2File: Mikrotikls RB951Ui 2HnD TstRpt 130317 r2Page 9 of 31

Radiated Emission Test Procedure

The EUT was placed on a rotating 1 x 1.5-meter wooden platform, 0.8 meters above the ground plane at a distance of 3 meters from the FSM antenna. Radiated emissions testing was performed as required in CFR47 15, RSS-210 and specified in sections 8 and 13.1.4 of ANSI C63.4-2009. EMI energy was maximized by equipment placement, raising and lowering the FSM antenna, changing the antenna polarization, and by rotating the turntable. Each emission was maximized before data was taken using a spectrum analyzer. The frequency spectrum from 9 kHz to 25,000 MHz was searched for during preliminary investigation. Refer to diagrams 2 and 3 showing typical test arrangement and photographs in the test setup exhibits for specific EUT placement during testing.

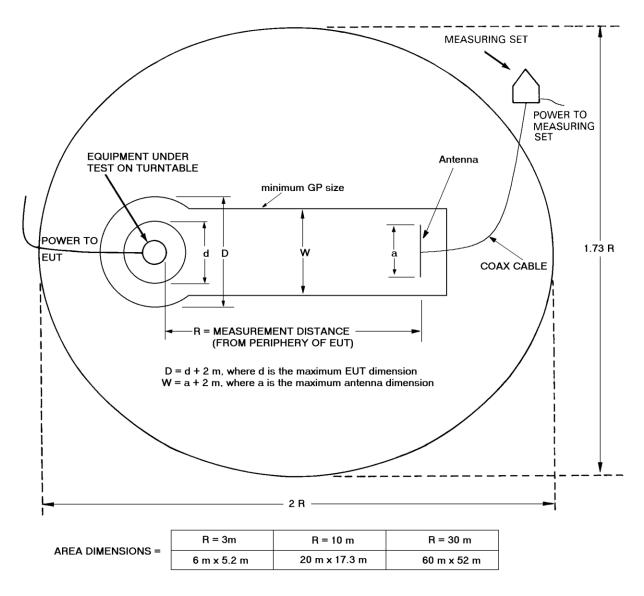

1. Interconnecting cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center, forming a bundle 30 cm to 40 cm long.

Rogers Labs, Inc.Mikrotikls SIA4405 W. 259th TerraceModel: RB951Ui-2HnDLouisburg, KS 66053Test #: 130317Phone/Fax: (913) 837-3214Test to: CFR47 (15.247)Revision 2File: Mikrotikls RB951Ui 2HnD TstRpt 130317 r2

SN: 42B901DDA60 FCC ID#: TV7RB951U-2HND Date: September 9, 2013 Page 10 of 31

- 2. I/O cables that are not connected to a peripheral shall be bundled in the center. The end of the cable may be terminated if required using the correct terminating impedance. The total length shall not exceed 1 m.
- 3. If LISNs are kept in the test setup for radiated emissions, it is preferred that they be installed under the ground plane with the receptacle flush with the ground plane.
- 4. Cables of hand-operated devices, such as keyboards, mice, and so on, shall be placed as for normal use.
- 5. Non-EUT components of EUT system being tested.
- 6. Rear of EUT, including peripherals, shall all be aligned and flush with rear of tabletop (possibly center of table for transmitter equipment).
- 7. No vertical conducting plane used.
- 8. Power cords drape to the floor and are routed over to receptacle.

List of Test Equipment

A Rohde and Schwarz ESU40 and/or Hewlett Packard 8591EM was used as the measuring device for the emissions testing of frequencies below 1 GHz. A Rohde and Schwarz ESU40 and/or Hewlett Packard 8562A Spectrum Analyzer was used as the measuring device for testing the emissions at frequencies above 1 GHz. The analyzer settings used are described in the following table. Refer to the appendix for a complete list of test equipment.

Intentional Radiators

As per CFR47, Subpart C, paragraph 15.247 the following information is submitted.

Antenna Requirements

The EUT incorporates integral antenna system and offers no provision for connection to alternate system. The antenna connection point complies with the unique antenna connection requirements. The requirements of 15.203 are fulfilled; there are no deviations or exceptions to the specification.

Restricted Bands of Operation

Spurious emissions falling in the restricted frequency bands of operation were measured at the OATS. The EUT utilizes frequency, determining circuitry, which generates harmonics falling in the restricted bands. Emissions were investigated at the OATS, using appropriate antennas or pyramidal horns, amplification stages, and a spectrum analyzer. Peak and average amplitudes of frequencies above 1000 MHz were compared to the required limits with worst-case data presented below. Test procedures of ANSI C63.4-2009 paragraphs 13.1 and 8.3.1.2 and KDB 558074 paragraph 10.2 were used during testing. No other significant emission was observed which fell into the restricted bands of operation. Computed emission values take into account the received radiated field strength, receive antenna correction factor, amplifier gain stage, and test system cable losses.

Summary of Results for Radiated Emissions in Restricted Bands

The EUT demonstrated compliance with the radiated emissions requirements of CFR 47 Part 15C Intentional Radiators. The EUT demonstrated a worst-case minimum margin of -3.5 dB below the radiated emissions requirements in restricted frequency bands. Peak, Quasi-peak, and average amplitudes were checked for compliance with the regulations. Worst-case emissions are reported with other emissions found in the restricted frequency bands at least 20 dB below the requirements.

AC Line Conducted Emissions Procedure

The EUT was arranged in a typical equipment configuration and placed on a 1 x 1.5-meter wooden bench 80 cm above the conducting ground plane, floor of a screen room. The bench was positioned 40 cm away from the wall of the screen room. The LISN was positioned on the floor of the screen room 80-cm from the rear of the EUT. The manufacturer supplied AC power adapter for the EUT was connected to the LISN. A second LISN was positioned on the floor of the screen room 80-cm from the rear of the supporting equipment of the EUT. All power cords except the EUT were then powered from the second LISN. EMI was coupled to the spectrum analyzer through a 0.1 µF capacitor, internal to the LISN. Power line conducted emissions testing were carried out individually for each current carrying conductor of the EUT. The excess length of lead between the system and the LISN receptacle was folded back and forth to form a bundle not exceeding 40 cm in length. The screen room, conducting ground plane, analyzer, and LISN were bonded together to the protective earth ground. Preliminary testing was performed to identify the frequency of each radio frequency emission displaying the highest amplitude. The cables were repositioned to obtain maximum amplitude of measured EMI level. Once the worstcase configuration was identified, plots were made of the EMI from 0.15 MHz to 30 MHz then the data was recorded with maximum conducted emissions levels. Refer to figures one and two for plots of the EUT powered by manufacturer supplied AC/DC adapter, AC Power Line conducted emissions.

Other emissions present had amplitudes at least 20 dB below the limit.

Summary of Results for AC Line Conducted Emissions

The EUT demonstrated compliance to the conducted emissions requirements of CFR47 Part 15C equipment. The EUT demonstrated minimum margin of -9.2 dB below the limit. Measurements were taken using the peak, quasi peak, and average, measurement function for each emissions amplitude and were below the limits stated in the specification. Other emissions were present with recorded data representing worst-case amplitudes.

General Radiated Emissions Procedure

The EUT was arranged in a typical equipment configuration and operated through all available modes with worst-case data recorded. Preliminary testing was performed in a screen room with the EUT positioned 1 meter from the FSM. Radiated emissions measurements were performed to identify the frequencies, which produced the highest emissions. Each radiated emission was then maximized at the OATS location before final radiated emissions measurements were performed. Final data was taken with the EUT located at the OATS at a distance of 3 meters between the EUT and the receiving antenna. The frequency spectrum from 9 kHz to 25,000 MHz was searched for general radiated emissions. Measured emission levels were maximized by EUT placement on the table, rotating the turntable through 360 degrees, varying the antenna height between 1 and 4 meters above the ground plane and changing antenna position between horizontal and vertical polarization. Antennas used were Loop from 9 kHz to 30 MHz, Broadband Biconical from 30 to 200 MHz, Biconilog from 30 to 1000 MHz, Log Periodic from 200 MHz to 1 GHz and or double Ridge or pyramidal horns and mixers from 1 GHz to 40 GHz, notch filters and appropriate amplifiers and external mixers were utilized.

 Table 5 General Radiated Emissions from EUT Data (Highest Emissions)

Other emissions present had amplitudes at least 20 dB below the limit. Peak and Quasi-Peak amplitude emissions are recorded for frequencies below 1000 MHz. Peak and Average amplitude emissions are recorded for frequencies above 1000 MHz.

Summary of Results for General Radiated Emissions

The EUT demonstrated compliance with the radiated emissions requirements of CFR47 Part 15C paragraph 15.209 Intentional Radiators. The EUT demonstrated a minimum margin of -4.2 dB below the requirements. Other emissions were present with amplitudes at least 20 dB below the Limits.

Mikrotikls SIA Model: RB951Ui-2HnD Test #: 130317 Test to: CFR47 (15.247) File: Mikrotikls RB951Ui 2HnD TstRpt 130317 r2

Operation in the Band 2400 – 2483.5 MHz

The transmitter output power; harmonics and general emissions were measured on an open area test site @ 3 meters. Test procedures of ANSI C63.4-2009 paragraphs 13.1 and 8.3.1.2 were used during testing. The EUT was placed on a wooden turntable 0.8 meters above the ground plane and at a distance of 3 meters from the FSM antenna. The peak and quasi-peak amplitude of frequencies below 1000 MHz were measured using a spectrum analyzer. The peak and average amplitude of frequencies above 1000 MHZ were measured using a spectrum analyzer. The amplitude of each emission was then recorded from the analyzer display. Plots were taken of the EUT during preliminary investigation for reference. Refer to figures three through five showing plots taken of the EUT performance displaying compliance with the specifications. Note the antenna transducer factor of 28 dB/m is not accounted for in the plot.

This product utilizes permanently attached antenna system and offers no provision for conducted antenna port measurements. Test procedures as defined in publications KDB 662911, KDB 558074 and ANSI C63.10-2009 were utilized for compliance testing. These procedures utilize measurement of maximum field strength and conversion calculation for comparison with requirements.

1. Calculate the transmitter's peak power using the following equation:

 $P = (E * d)^2 / (30 * G)$

- Where: E = the measured maximum field strength in V/m.
 - G = the numeric gain of the transmitting antenna over an isotropic radiator.
 - d = the distance in meters from which the field strength was measured.
 - P = the power in watts

Setting the RBW > 6dB bandwidth of the emission or using a peak power meter Power measurements were conducted utilizing the channel power measurement function of the ESU40 receiver.

- 2. Emission Bandwidth was measured in compliance with KDB 558074 paragraph 7.
- Maximum Peak Output Power was measured in compliance with KDB 558074 paragraph 8.
- 4. Maximum Power Spectral Density was measured in compliance with KDB 558074 paragraph 9.
- 5. Maximum Unwanted Emissions Levels were measured in compliance with KDB 558074 and CFR47 paragraph 15C at 3-meters distance located on the OATS.
- 6. Band Edge compliance was performed in compliance with KDB 913591.

Summary of Results for Transmitter Radiated Emissions of Intentional Radiator

The EUT demonstrated compliance with the radiated emissions requirements of CFR47 Part 15.247, KDB 662911 D01 Multiple Transmitter Output v02, and KDB 662911 D02 MIMO with Cross Polarized Antenna v01. Calculated Peak conducted power of 29.2 dBm, 0.83 Watts. Power calculations include operation as 2x2 MIMO with design incorporating permanently attached internal antenna system. The peak power spectral density presented a minimum margin of -9.1 dB below the requirements. The EUT demonstrated a minimum margin of -11.6 dB below the harmonic emissions requirements. There were no other significantly measurable emissions in the restricted bands other than those recorded in this report. Other emissions were present with amplitudes at least 20 dB below the requirements. There were no other deviations or exceptions to the requirements.

Statement of Modifications and Deviations

No modifications to the EUT were required for the unit to demonstrate compliance with the CFR47 Part 15C emissions standards. There were no deviations to the specifications.

Registration Number: 90910

Rogers Labs, Inc. 4405 West 259th Terrace, Louisburg, KS 66053

Attention: Scot Rogers,

Re: Measurement facility located at Louisburg 3 & 10 meter site Date of Renewal: November 01, 2011

Dear Sir or Madam:

Your request for renewal of the registration of the subject measurement facility has been received. The information submitted has been placed in your file and the registration has been renewed. The name of your organization will remain on the list of facilities whose measurement data will be accepted in conjunction with applications for Certification under Parts 15 or 18 of the Commission's Rules. Please note that the file must be updated for any changes made to the facility and the registration must be renewed at least every three years.

Measurement facilities that have indicated that they are available to the public to perform measurement services on a fee basis may be found on the FCC website <u>www.fcc.gov</u> under E-Filing, OET Equipment Authorization Electronic Filing, Test Firms.

Sincerely, Phyllis Parrish

OUR FILE: 46405-3041 Submission No: 152685

Rogers Labs Inc. 4405 West 259th Terrance Louisburg, KS, 66053 USA

Attention: Mr. Scot D. Rogers

Dear Sir/Madame:

The Bureau has received your application for the renewal of 3/10m OATS. Be advised that the information received was satisfactory to Industry Canada. The following number(s) is now associated to the site(s) for which registration / renewal was sought (Site# 3041A-1). Please reference the appropriate site number in the body of test reports containing measurements performed on the site. In addition, please keep for your records the following information;

- The company address code associated to the site(s) located at the above address is: 3041A

Furthermore, to obtain or renew a unique site number, the applicant shall demonstrate that the site has been accredited to ANSI C63.4-2003 or later. A scope of accreditation indicating the accreditation by a recognized accreditation body to ANSI C63.4-2003 or later shall be accepted. Please indicate in a letter the previous assigned site number if applicable and the type of site (example: 3 metre OATS or 3 metre chamber). If the test facility is not accredited to ANSI C63.4-2003 or later, the test facility shall submit test data demonstrating full compliance with the ANSI standard. The Bureau will evaluate the filing to determine if recognition shall be granted.

The frequency for re-validation of the test site and the information that is required to be filed or retained by the testing party shall comply with the requirements established by the accrediting organization. However, in all cases, test site re-validation shall occur on an interval not to **exceed three years**. There is no fee or form associated with an OATS filing. OATS submissions are encouraged to be submitted electronically to the Bureau using the following URL;

http://strategis.ic.gc.ca/epic/internet/inceb-bhst.nsf/en/h_tt00052e.html.

If you have any questions, you may contact the Bureau by e-mail at <u>certification.bureau@ic.gc.ca</u> Please reference our file and submission number above for all correspondence.

Yours sincerely,

Dalwinder Gill For: Wireless Laboratory Manager **Certification and Engineering Bureau** 3701 Carling Ave., Building 94 P.O. Box 11490, Station "H" Ottawa, Ontario K2H 8S2 Email: dalwinder.gill@ic.gc.ca Tel. No. (613) 998-8363 Fax. No. (613) 990-4752
