RE: NESS Ltd.

FCC ID: TVF-L300-STM-V10

After a review of the submitted information for FCC, I have a few comments on the above referenced Application.

- 1) This is a portable device, but it is uncertain if it was tested in all 3 axis in effort to obtain worse case radiated measurements (power and spurious). Please review.
- 2) It can not be determined from the test photos if the electrodes were correctly loaded during test. Please comment.
- 3) Please provide the manufacturers declaration for duty cycle as referenced in the test report that justifies appropriate duty factors applied. Where possible, the FCC also wants measured data to show theory is correct.
- 4) Users manual appears to be missing information required by 15.21. Please review/correct as necessary.
- 5) FYI....Under 15.247, it is recommended to provide an RF exposure exhibit regardless of output power. Please see attached as an example.
- 6) FYI....The spectral density should normally be calculated for 15.247 in cases where this may not be done at the antenna connector (see attached document). However given the power is < the spectral density limit, the spectral density will also be in compliance and we are therefore not requiring this to be retested.

The items indicated above must be submitted before processing can continue on the above referenced application. Failure to provide the requested information may result in application termination. Correspondence should be considered part of the permanent submission and may be viewed from the Internet after a Grant of Equipment Authorization is issued.

Please do not respond to this correspondence using the email reply button. In order for your response to be processed expeditiously, you must submit your documents through the AmericanTCB.com website. Also, please note that partial responses increase processing time and should not be submitted.

Any questions about the content of this correspondence should be directed to the sender.
