

GB8209 circuit description

Simple description:

1)First the apparatus can be supplied by switch adapter or battery,then get a steady d.c voltage,after wave filter,transformer, so can supply different module circuit separately with different voltage.

2)The video signal can be collected by CMOS chip,then be sent to video encoder through sensor;and radio signal will be collected by MIC , then be processed by audio processor ; finally,video signal and audio signal was added to the carrier frequency band in MCU,then these signal pass 2.4G transmitter and shall be sent out by antenna.
